

TRD / ACC / TAS
Slow Control and Data Monitoring
Version 25, 23rd February 2016

B. Beischer, Ch Chung, Th. Kirn, Th. Siedenburger

I. Phys. Institute B,

K. Andeen, S. Zeissler

IEKP  - KIT Campus South

TRD-ACC-TAS SHIFTER: TRD-ACC-TAS Phone Numbers

Expert Telephone Numbers:

TRD Expert Oncall Mobile: 16 9779 (from outside CERN: +41 76 487 9779)

Stefan Zeissler: Office: +41 (0)22 767 6135

Bastian Beischer: Mobile: +49 160 964 33550

Chan Hoon Chung: Office: +49 241 80 27263

Thomas Kirn: Office: +49 241 80 28722 or +49 241 80 27186

Thorsten Siedenburg: Office: +49 241 80 27186; Private: +49 241 4002544;
Mobile: +49 157 88464495

Valery Zhukov: Office: +41 (0)22 767 8188 Mobile: +41 76 487 6537

Email adress for TRD/ACC/TAS experts: trd-expert@cern.ch

Email addresses for local experts: email if you have a non-critical problem
(if you aren't sure wether it's non-critical, it's better to call!):

Stefan: stefan.zeissler@cern.ch

Valery: joukov@cern.ch or vzhukov@physik.rwth-aachen.de

Contents:

1. <u>TRD/ACC/TAS-standard shift</u>	4
2. <u>TRD/ACC/TAS-shift setup</u>	12
3. <u>TRD-ACC-TAS-Checklists</u>	28
4. <u>Description ACC Programs + Trouble Shooting</u>	46
5. <u>Description TAS Programs + Trouble Shooting</u>	72
6. <u>Description TRD/TRDGas Programs + Trouble Shooting</u>	80
1. <u>TRD Monitoring</u>	99
2. <u>TRD Gas Monitoring</u>	119
7. <u>TRD Expert Tools</u>	134
8. <u>TRD Procedures</u>	141
1. <u>TRD HV Changing</u>	142
2. <u>TRD Vessel Heaters and/or Pump on/off</u>	163
3. <u>TRD Power Down/Up (HV ON/OFF)</u>	183
4. <u>TRD Gas Refill</u>	243

TRD/ACC/TAS-Standard Shift

List of TRD/TRDGas Programs

Electronics Monitoring:

- TRD Status Monitor (TRD-S)
- Pedes_Canvas
- UDR_HK_Canvas
- UHV Status Monitor (UHV-S)

Gas Monitoring:

- TRDGAS Monitor (TRDGAS-M)
- TRDGAS Status Monitor (TRDGAS-S)

Detector Monitoring:

- TRD-DTS Monitor (TRDDTS-M)
- TRD-Gain Monitor (TRD-GainMonitor)
- TRD-Pressure Monitor (TRD-PressureMonitor)

TRD/ACC/TAS-Standard Shift

List of ACC Programms:

- ACC Status Monitor (ACC-S)
- ACC Slow Control Monitor (ACC-M)
- ACC Data Monitor (ACC-data-M)

List of TAS Programms:

- TAS Status Monitor (TAS-S)
- TAS Data Monitor (TAS-M)

TRD-ACC-TAS SHIFTER: TRDGas Standard Monitoring Shift

Start-up of AMS-Activation:

AMS Power-Step-1 from LEAD Post

- Initializes TRDGAS Crate (UG)
- Configures and starts UG CtrlTsk
- Activates UG Q-List items 7A/7B

HV ON: LEAD asks if TRD Gas is ok

Standard Shift Activity:

- **No** TRDGAS commanding in standard shift
- **Fill** out the two checklists (one for TRD/TAS and one for ACC)
- **Adjust** TRD HV once per day by a xxx V step (only TRD shifter)
(MOP-ADC value ≈ 60 , xxx V step to be determined!)
details see pages 92-97, 129-131
- **Check: TRDGAS monitor data available**
All plots in TRDGAS-M update
- **Check: Pressures and Temperatures in range**
TRDGAS-S is updating regularly

TRD-ACC-TAS SHIFTER: TRD Gas Emergency Actions

Emergency Actions from TRD Post CALL EXPERT

- Xe/C02 Vessel High Pressure (>175/100bar)
- Xe/C02 Vessel High Temperature (>+60°C)
- Xe/C02 Vessel Low Temperature (<-20°C)
- Xe/C02 Vessel Low Temperature (<-40°C)
Requires UGPD-B powered and all DC/DC on
- Xe/C02 Vessel Low Temperature (<-50°C)
- Mixing Vessel High Pressure (>13bar)
- Box-C High Pressure (>1500mbar)
- TRD High Pressure (>1300mbar)
- TRD Low Pressure (< 750mbar)

- TRD-SidePanel High Temperature (>+40°C)
Ask LEAD to disable TRD 120V Heaters
- TRD-SidePanel High Temperature (>+50°C)
Option: ask LEAD for AMS StandBy
- TRD-SidePanel Low Temperature (<+5°C)
Ask LEAD to switch ON TRD 120V Heaters A & B
- TRD-SidePanel Low Temperature (<-20°C)

- Box-C Low Temperature (< 9°C)

last Option:

ASK for Commanding

- UG Heaters DISABLE
- UG Heaters DISABLE
- HEAT VESSELS (UG-A)
- HEAT VESSELS (UG-B)

- Turn AMS into sun
- VENT MIX
- VENT Box C
- Flipper Valves CLOSE
- Flipper Valves CLOSE
- ask LEAD: TRD HV OFF
- Flipper Valves CLOSE
(PDS 120V Heater #3)
- ask LEAD: TRD StandBy
- Turn TRD away from sun
- Flipper Valves CLOSE
(PDS 120V Heater #3)
- Turn AMS into sun

- HEAT Xe-VESSEL (UG-A)

TRD-ACC-TAS SHIFTER: TRD Standard Monitoring Shift

- Check: TRD data monitor (Pedes_Canvas.ps, UDR_HK_Canvas)
- Check: TRD Temperatures in range (TRDGAS-S and TRD Sidepanels)

Emergency Actions from TRD Post CALL EXPERT
-TRD HV Trip!

ASK for Commanding
ASK LEAD to stop DAQ
Go to [TRD-HV](#)

reset HV by pressing
button `HV On`

TRD-ACC-TAS SHIFTER: ACC Standard Monitoring Shift

- Check: ACC slow control data and data monitor (ACC-M, ACC-data_M)
- Check: ACC scaler rates, HV-settings, Temperatures in range (ACC-S)

Emergency Actions from Shifter

ASK for Commanding

1. Temperature PMT-Box out of Range
(Operational: -30°C ... $+45^{\circ}\text{C}$, Non-Operational: -35°C ... $+50^{\circ}\text{C}$)
LEAD: Turn ACC-HV off
 2. Scaler rate too high (>35000 outside SAA and polar regions)
Report to LEAD,
LEAD reduce HV
 3. Scaler rate zero -> HV off
 -> HV on, ADC-spectra Pedestal line
 -> PMT dead
LEAD: Turn ACC-HV on
LEAD: configure JLV1
- > cooperate with TOF-Shifter!
- > make an entry in E-Log: TEE and TOF
- > Phone ACC-expert and/or send an email to trd-expert@cern.ch!

- Check: TAS slow control data (TAS-M)
- Check: TAS laser current, width and LFCR-temperatures (TAS-S)

Emergency Actions from TAS Shifter

Out of Current / Width Range
($I = 10 - 20 \text{ mA}$, $w = 0.5 \text{ us}$)

Out of Temperature Range
Nominal 0°C to $+30^{\circ}\text{C}$

20 Diodes Runs / Hour
 $10(20\text{mA}) + 10(10\text{mA})$ Runs

Request CMD to stop TAS calibration and then
check TAS configuration

(TAS config. : http://ams.cern.ch/AMS/DAQ/ams02_cmds/POWERSTEPS/TAS_20runs.txt)

Ask CMD for status of TRD Heaters (PDS) and
then request stop TAS calibration until
temperature comes back within operating range

Report CMD about missing diode runs
and check status of JMDC
(mostly it happens with JMDC crashed)

**Any case of problems
Make an entry in E-log::TAS**

TRD-ACC-TAS SHIFT SETUP

TRD-ACC-TAS SHIFT SETUP

Start all Programs from Scratch !!!

TRD-ACC-TAS SHIFT SETUP

Login on PCP0C25 as user trd,
password: 2011may19
Push login button

Go to any Screen and open terminal [top-left bar of desktop has the icon]

```
trd@pcpoc25 $ cd ~/RUN/  
trd@pcpoc25 RUN $ TRD_ACC_TAS_ShiftStart.sh  
(This should work in both in Taiwan and at CERN but there is also  
TRD_ACC_TAS_ShiftStart_TAIWAN.csh if Taiwan has problems).
```

**It will open with a pop-up window: read it and push OK.
Then: DO NOT TYPE OR MOVE THE MOUSE WHILE IT IS RUNNING!**
It will tell you when it is finished.

This should open ALL shifter programs, start them running and put them in the right places. Only the TRD-GainMonitor, the TRD-PressureMonitor, and the OSTPV need opened by hand by pushing enter in their terminals (their terminals are opened and the commands are typed automatically: you only have to hit ENTER if you want them or kill their terminals if you don't).

CHECK using the screenshots on the next pages to be sure that everything is in it's proper place and running properly! Specifically, compare these things to the screenshots and fix them if they don't match:

- X (= 0 or 2)
- Running Directory (HKLR/CDP, HKHR/CDP or SCIBPB/RT)
- The READ button should be **RED**

Instructions follow for opening each program individually from a terminal. If you need to do this please organize them in the same way they are in the screenshots.

Screen 1 Left (Global Monitoring)

The screenshot displays a complex software interface for global monitoring, divided into several main sections:

- TRDGas Status Monitor:** Shows gas pressure and temperature for TRDGas, with status indicators for Press, Temp, and Leak.
- ACC Status Monitor:** Displays HV status, Temperature, and Scalers.
- TAS Status Monitor:** Shows Laser Current, Temperature, and Pulse Width.
- TRD Status Monitor (Top Right):** Monitors U0 and U1 systems, including JINF & Crate Power, HV (GCI-3.5-10/GC4), and UDR & DAQ.
- TRD Status Monitor (Bottom Right):** Similar to the top right, monitoring U0 and U1 systems.
- UHV Status Monitor:** Monitors UHV voltages and alarms, with a table showing ADC values and ages for U0 Side A and B, and U1 Side A and B.
- LOOK-ATOP:** A central window showing system tasks and memory usage.
- GROUND COMMANDS:** Lists various commands and their parameters.
- CHD DISP:** Displays channel data and status.
- OSTP Client:** Shows a graphical plot of data over time for various channels like Munich 331, Houston 331, GMT 331, TDERS ALL, Altitude, Day/Night, SAA, and DailyOrbit.

Screen 1 Left (Global Monitoring)

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ TRDGAS-S &
Move to this location
Start running (see page 17)
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ ACC-S &
Move to this location
Start running (see page 17)
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ TAS-S &
Move to this location
Start running (see page 17)
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ cmds_mon -g -m HOSC
Move to this location
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ CHD_DISP -m HOSC &
type ctrl - to shrink the text font so it doesn't split the lines.
Move to this location
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ OSTPV &
4 8 12 24**

This will ask for a password. You will have to have set up the OSTPV according to these instructions from Mike () If you haven't done this, don't worry, either ask someone who has (Mike and Jens have it) or skip it since every control room has an OSTPV visible. It's not necessary.

Once it opens, move it here.
Right click header bar and choose "always on visible workspace"

Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ TRD-S-HK 2 &
Move to this location
Start running (see page 17)
Right click header bar and choose "always on visible workspace"**

**trd@pcpoc25\$ cd ~/RUN/
trd@pcpoc25\$ UHV-S &
Move to this location
Start running (see page 17)
Right click header bar and choose "always on visible workspace"**

All programs that look like this are started in this way...

1) Set X to 0 or 2 (look at screenshots)

left-click ↑ number
right-click ↓ number

(Note: For those monitors with X set to 2, ONLY do this on the TEE shifter console; if LEAD starts additional TRD-S-HK, LEAD must set it X to 0, otherwise produced UDR-HK-Canvas gets corrupted)

3) Find Last File (left click)

4) Load for reading (left click)

5) Read continuously (right click)—should turn from green to red!

2) Set Directory to Data/BLOCKS/SCIBPB/RT OR Data/BLOCKS/HKLR/RT OR Data/BLOCKS/HKHR/CDP (check screenshots to find out which directory to use for each monitor)

The screenshot shows the TRD Status Monitor window. At the top left, there is a control for 'X' set to '2'. Below it is a 'Directory' field containing '/Data/BLOCKS/SCIBPB/RT'. To the right, there are 'File' and 'Time' fields. The 'File' field shows '1000 922' and the 'Time' field shows '20131127 13:49:00'. A 'READ' button is highlighted in red. Below these are two columns of status monitors for 'U0' and 'U1'. Each column has three rows: 'JINF & Crate Power', 'HV (GC1-3,5-10/GC4)', and 'UDR & DAQ'. Each row shows 'Status' and 'OK' indicators. At the bottom, there are fields for 'Hits/Event' (694), 'Common Mode (ADC)' (0.342), 'Amplitude' (219.80), and 'STATUS' (OK). A 'State Interval' dropdown is set to 'never'. The bottom status bar shows file paths: '/Data/BLOCKS/SCIBPB/RT/1000922' and '/Data/BLOCKS/SCIBPB/RT/1000921'.

Eventually all the boxes should turn green, but sometimes this can take 20 minutes or more depending on the data stream, etc... be patient.

OR you can get the latest file (step 3) and THEN click back a few hundred files (ex. in this case above, change 559 to 449 or earlier) which will start reading older files and will catch up to your latest files quickly.

Screen 1 Right

Screen 2 Right (TAS)

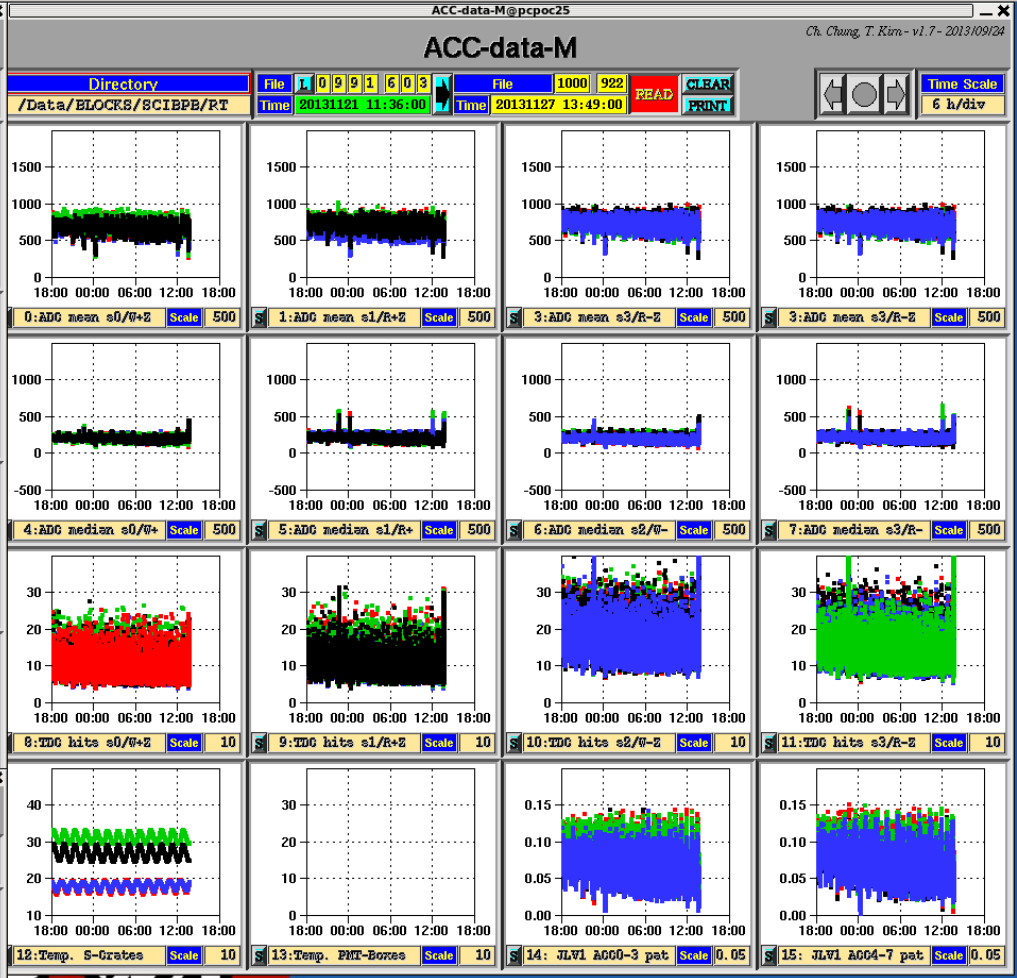

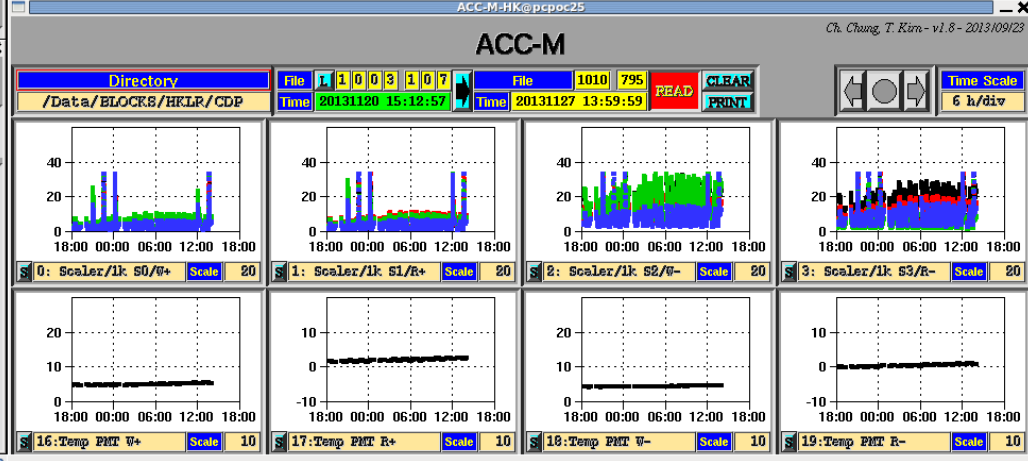

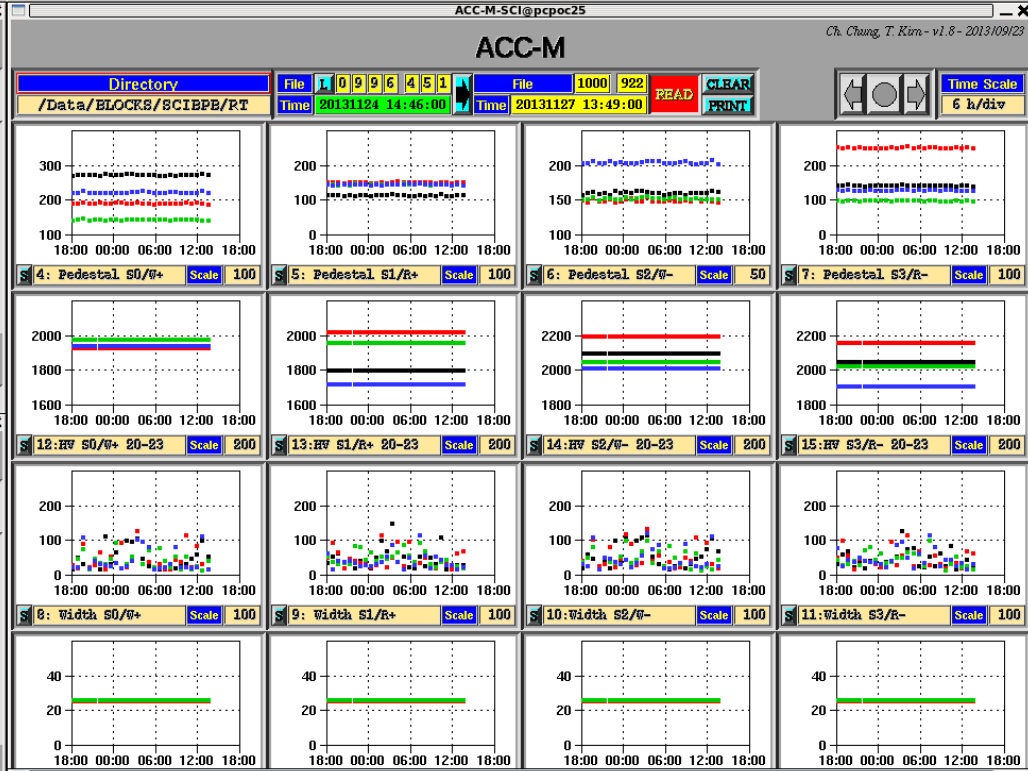

Screen 2 Right (TAS)

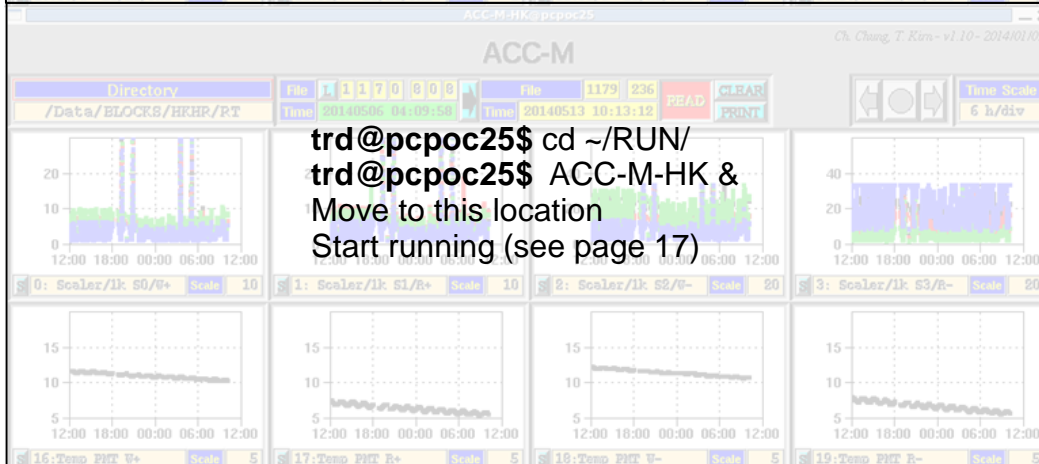

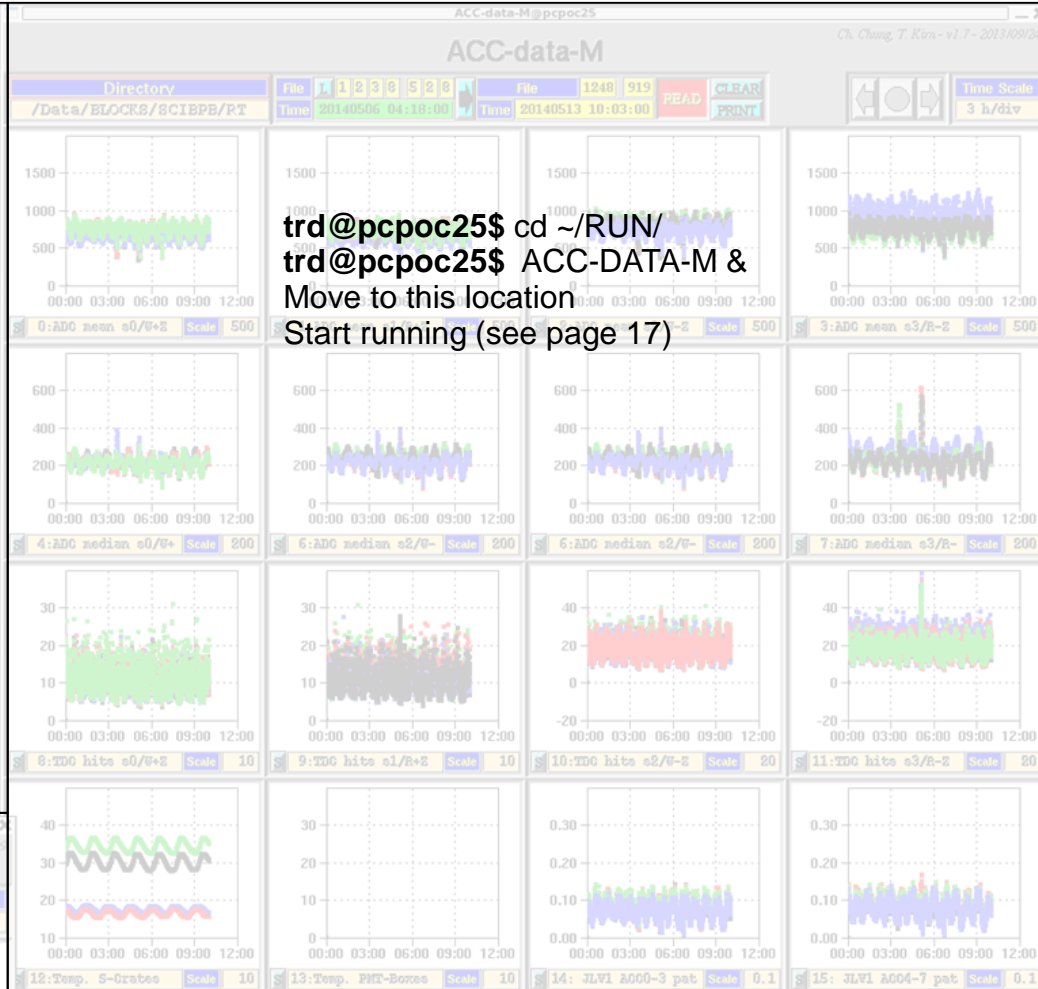

Screen 3 Right (ACC)

Screen 3 Right

EXPERTS: Screen 4 Right (HV Adjust)

Go to Screen 4 Right (HV Adjust): ONLY FOR EXPERTS

The automatic script mostly takes care of this for you, you have to hit **ENTER**, as below

Xterm SHOULD be open and SHOULD have changed to the ~trd/RUN/ directory:

The command TRD-GainMonitor SHOULD already be in the field, like so:

```
trd@pcpoc25 $ cd ~trd/RUN/  
trd@pcpoc25 RUN$ TRD-GainMonitor
```

Hit **ENTER** and it will bring-up the program, after it's open click "update and save all". For more details on the gain monitor see page 109.

Xterm SHOULD be open and SHOULD have changed to the ~trd/RUN directory:

The proper command path SHOULD also be set, like so:

```
trd@pcpoc25 $ cd ~trd/RUN/  
trd@pcpos25 RUN$ set-command-path eas:hosc feplr
```

The HV adjustment (HV channel intercalibration or overall adjustment) is done by using 2 scripts:

```
prepare-trd-hv -value      (should be done only 10 min before adjustment)  
apply-trd-hv              (must be done at equator before calibration)
```

(for both scripts you need commanding from LEAD!!!)

Place Programs on top of corresponding xterm (as shown in layout)

Screen 5 Right (Commanding)

Go to Screen 5 (Commanding) Right:

ONLY FOR EXPERTS

(The automatic script mostly takes care of this for you – you have to hit ENTER, as below)

Xterm SHOULD be open and SHOULD have changed to the ~/RUN/ directory:
The command TRD-PressureMonitor SHOULD already be in the field, like so:

```
trd@pcpoc25  $ cd ~trd/RUN/  
trd@pcpoc25 RUN$ TRD-PressureMonitor
```

Hit ENTER and it will bring up the program – after it's open click "update and save all". For more details on the pressure monitor see page 115

Place Programs on top of corresponding xterm (as shown in layout);

TRD-ACC-TAS Checklists

Fill Out Your TRD Checklist!

TRD Status Monitor: TRD Checklist Section 1

1. TRD Status (TRD-S-HK)	
U0	
JINF & Crate Power	Check if the corresponding boxes are green (= OK)
HV	
UDR & DAQ	
HV Value	Write the current voltage <input type="text"/>
U1	
JINF & Crate Power	Repeat the same for the right side (U1)
HV	
UDR & DAQ	
HV Value	

If any box is **red**:

- (1) Check the elog: is there a note from an expert?
- (2) If there is no note and it does not turn **green** after ~25 minutes of AOS, put a screenshot on the elog and call the trd oncall expert.

UHV Status Monitor: TRD Checklist Section 1

UHV-S@pcpoc25 A. Sabellek - v1.9 - 2013/09/24

UHV Status Monitor

State Interval: never

Directory: /Data/BLOCKS/HKLR/CDP

File: L1003105 | File: 1010 795 | Time: 20131120 15:10:56 | Time: 20131127 13:59:59

Buttons: READ, CLEAR, PRINT

UHVG Voltages and Alarms												ADC
U0 Side A						U0 Side B						Age
-	-	-	-	-	-	1389	1383	1393	1397	1392	1382	9 min
-	-	-	-	-	-	1384	1387	1390	1393	1401	1391	Blue box
-	-	-	-	-	-	1396	1398	1391	1387	1384	1396	
-	-	-	-	-	-	1394	1398	1388	1391	1398	1394	
-	-	-	-	-	-	1388	1392	1394	1399	1393	1395	
-	-	-	-	-	-	1385	1386	1391	1390	1393	1394	
-	-	-	-	-	-	1387	1384	1392	1391	1390	1380	
-	-	-	-	-	-	1389	1383	1393	1397	1392	1382	
U1 Side A						U1 Side B						Age
-	-	-	-	-	-	1404	1386	1386	1386	1402	1390	8 min
-	-	-	-	-	-	-	1402	1395	-	1401	1390	Blue box
-	-	-	-	-	-	1397	1396	1395	1397	1394	1400	
-	-	-	-	-	-	1397	1397	1395	1401	1388	1395	
-	-	-	-	-	-	1398	1388	1386	1399	1386	1396	
-	-	-	-	-	-	1394	1388	1397	1393	1390	1400	
-	-	-	-	-	-	1382	1382	1400	1400	1395	1400	

Also check the UHV status monitor. The individual high voltages should all be similar, and none should be missing except those already missing. If anything changes or any box is red:

- (1) Check the elog: is there a note from an expert?
- (2) If there is no note and it does not turn green after ~25 minutes of AOS, put a screenshot on the elog and call the trd oncall expert.

TRD Gas Status Monitor: TRD Checklist Section 2

2. TRD Gas Status (TRDGAS-S)	
TRD Gas Pressure	
TRD Gas Temperature	
TRD Pressure	
TRD Temperature	
Leak	

Check if the corresponding boxes are green (= OK)

If any box turns **red**:

- (1) Check the elog: is there a note from an expert? (i.e. Leak and Pressures turn red during the refill and when the pump is on, Temperatures may turn red during a cold phase)?
- (2) Talk to LEAD/Thermal: is there something happening that could cause this?
- (3) If there is no note and it does not turn **green** after ~25 minutes of AOS, put a screenshot on the elog and call the trd oncall expert.

A note about **errors**: the errors in this status box happen regularly. If they happen **once** and do not continue (like above), it's fine. If the same error repeats continuously this is bad, and it should cause one of the status boxes to turn **RED**. **Whether or not** the status turns **RED**, if any error is **continuous** (i.e. repeats many times in a row) call the trd oncall expert.

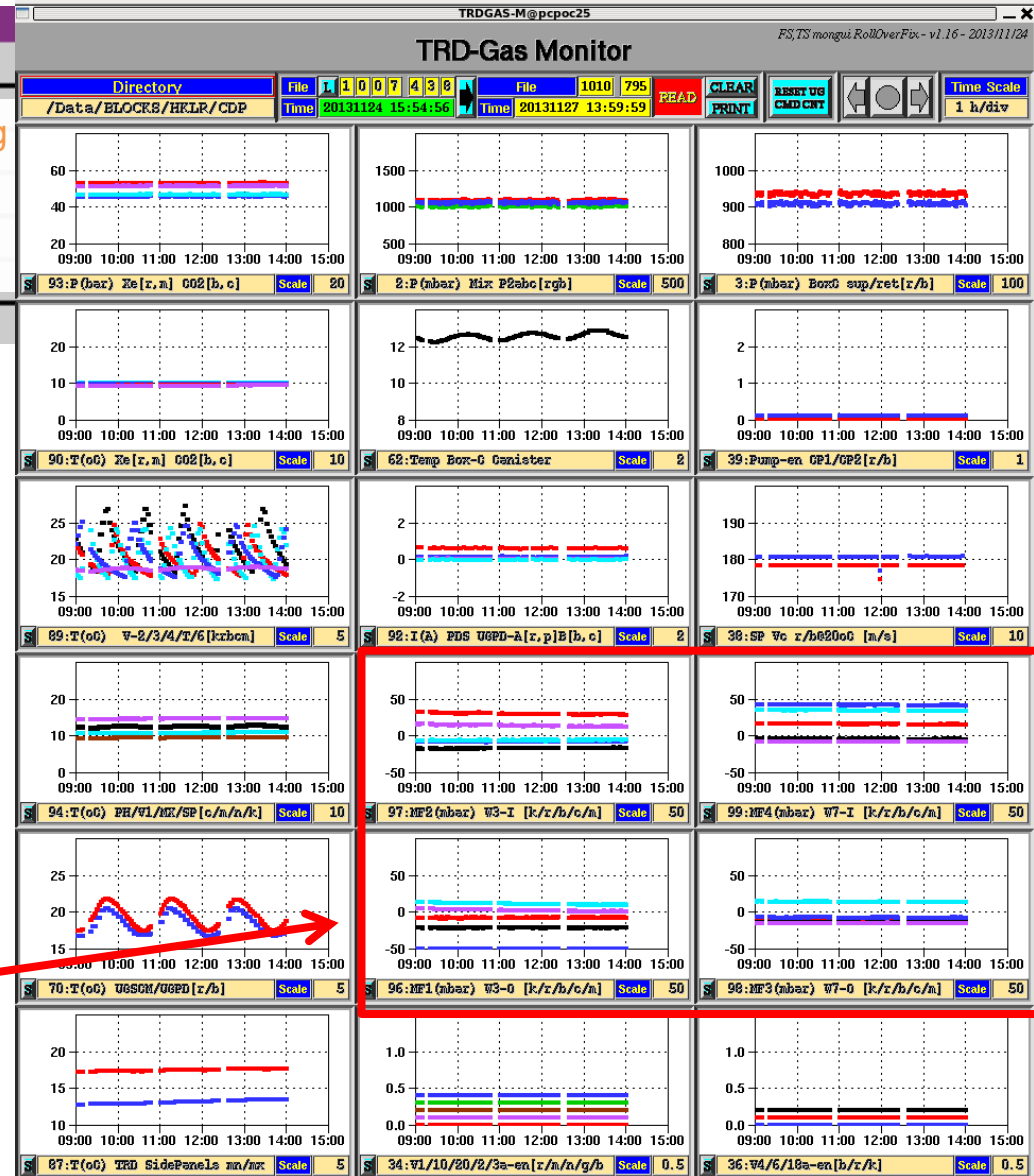

TRD-Gas Monitor: TRD Checklist Section 3

3. TRD-Gas Monitor (TRDGAS-M): plot number in paranthesis

- (93) Pressure Xe < 175 bar
- (93) Pressure CO2 (93) < 100 bar
- (90) Temperature Xe/CO2 [-20;60]
- (62) Temperature Box-C > 10
- (2) Pressure Mixing < 13 bar
- (96-99) Manif. Pres (MF1-MF4) ~constant

Check if the corresponding plots (in parenthesis on each line) are within the appropriate range

- If something is **briefly out of range** for 1-2 data points (like plot 38 at 12:00): do not worry, watch to make sure it comes back within range (this happens sometimes).
- If anything is **consistently out of range**:
 - (1) Check the elog: is there a note from an expert?
 - (2) Talk to Thermal and LEAD—is this a known problem?
 - (3) If there is no note and no one else knows what's going put a screenshot on the elog and call the trd oncall expert.

About Manifold pressures: these should be *approximately* constant; however, when heaters automatically turn on/off or the pump turns on/off you will see gradual changes. Those changes should correspond to a temperature change in plot 87 or 94. This is normal and happens all the time. However, if 87 and 94 both show all temperatures **constant**, changes in the manifold pressures could indicate a **leak**. **Call the expert immediately**. If there is a **sudden break** (not just one data point), this is **not OK**. **Call the expert immediately!**

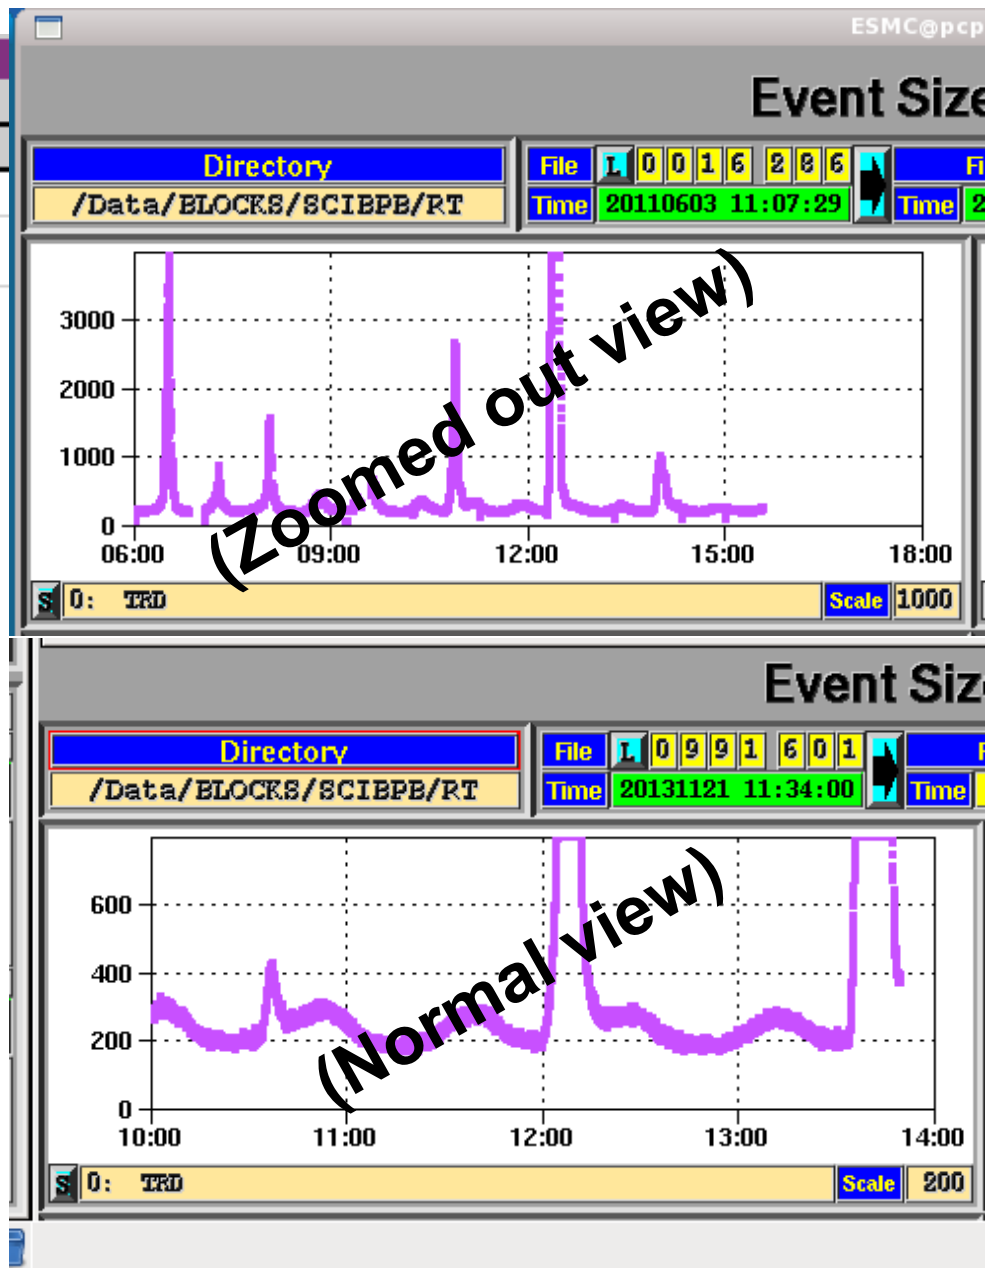

Event Size Monitor: TRD Checklist Section 4

4. Event Size Monitor (ESMC)	
TRD Event size > 150	Check that the TRD Event size is above 150 and that there are no abrupt changes (~stable).
TRD Event size (average)	Average size on right ~200—do not include SAA and polar regions.

If the *average* (not including TAS runs, SAA and polar regions) becomes much higher than ~200, or it becomes unstable:

- (1) Check the elog: is there a note from an expert?
- (2) Talk to the other detectors and LEAD—is this a known problem? Did something happen?
- (3) If there is no note and no one else knows what's going on put a screenshot on the elog and call the trd oncall expert.

Calibrations: TRD Checklist Section 4

Also check:

Calibration of each of the 5248 Straw-Tubes

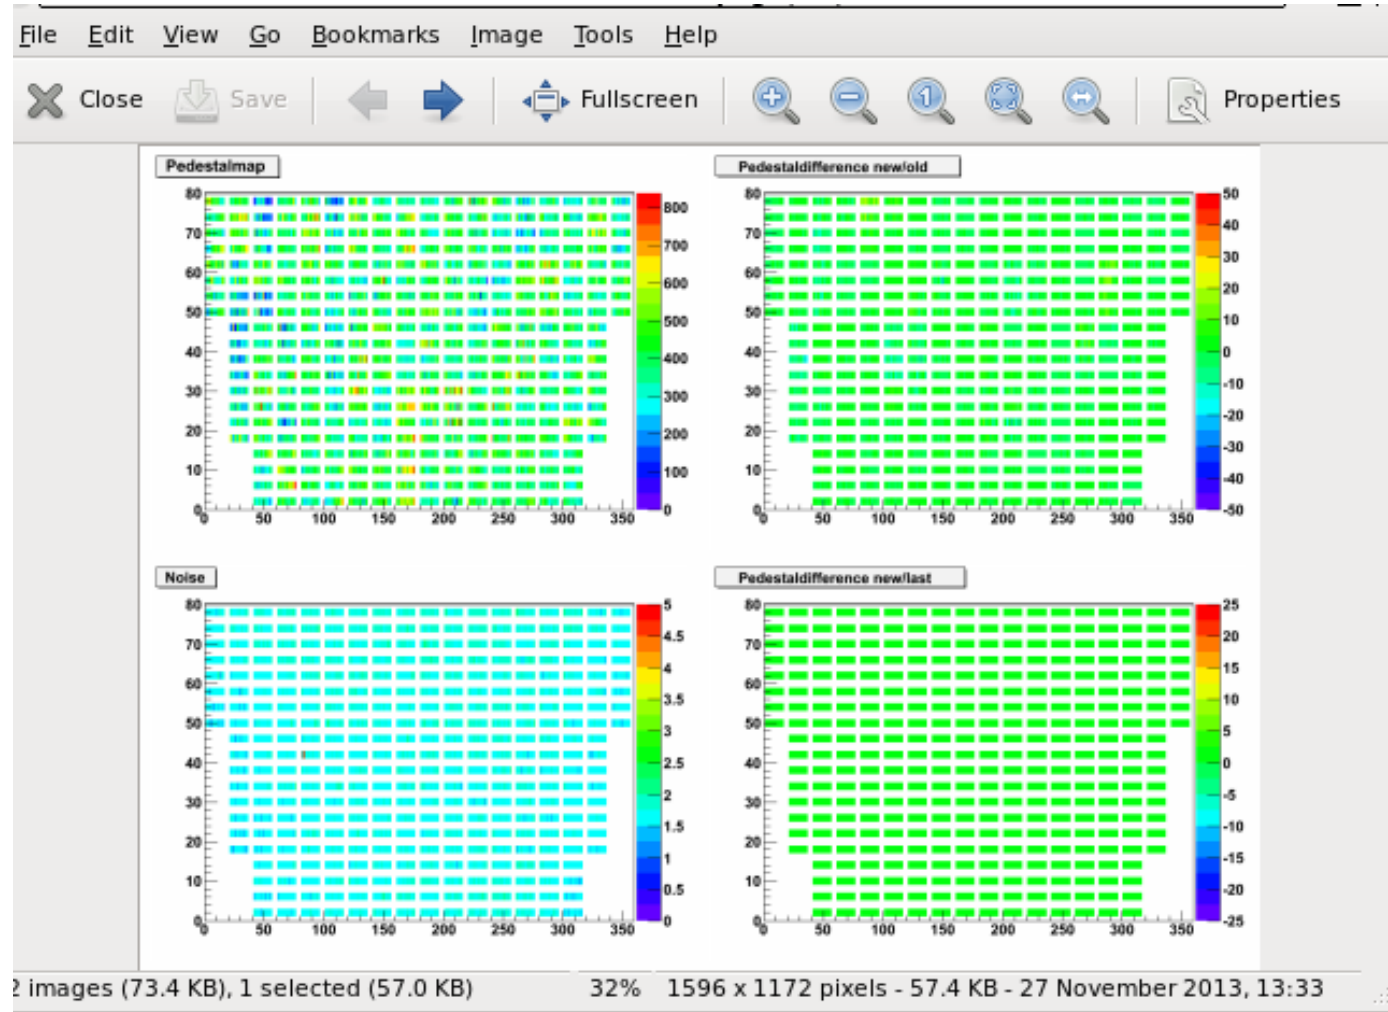

Upper left: Actual Pedestal values in ADC channels

Upper Right: Difference between actual and default Pedestal values

Lower Left: Actual Noise values in ADC channels

Lower Right: Difference between actual and last Pedestal values

To check: Noise should show usual pattern (all but 2 channels green for A-Side Power, also slightly higher noises on end/front of segment for B-Side Power.)

If the pattern looks very inhomogeneous (i.e. during SAA), wait for a new calibration (every equator crossing). If it still looks bad, ask LEAD if the calibration times in the TQ list matches the OSTPV (more than 1 minute difference can cause bad calibrations). If this is not a problem, email the trd experts and attach a screenshot

Occupancy and Amplitudes: TRD Checklist Section 4

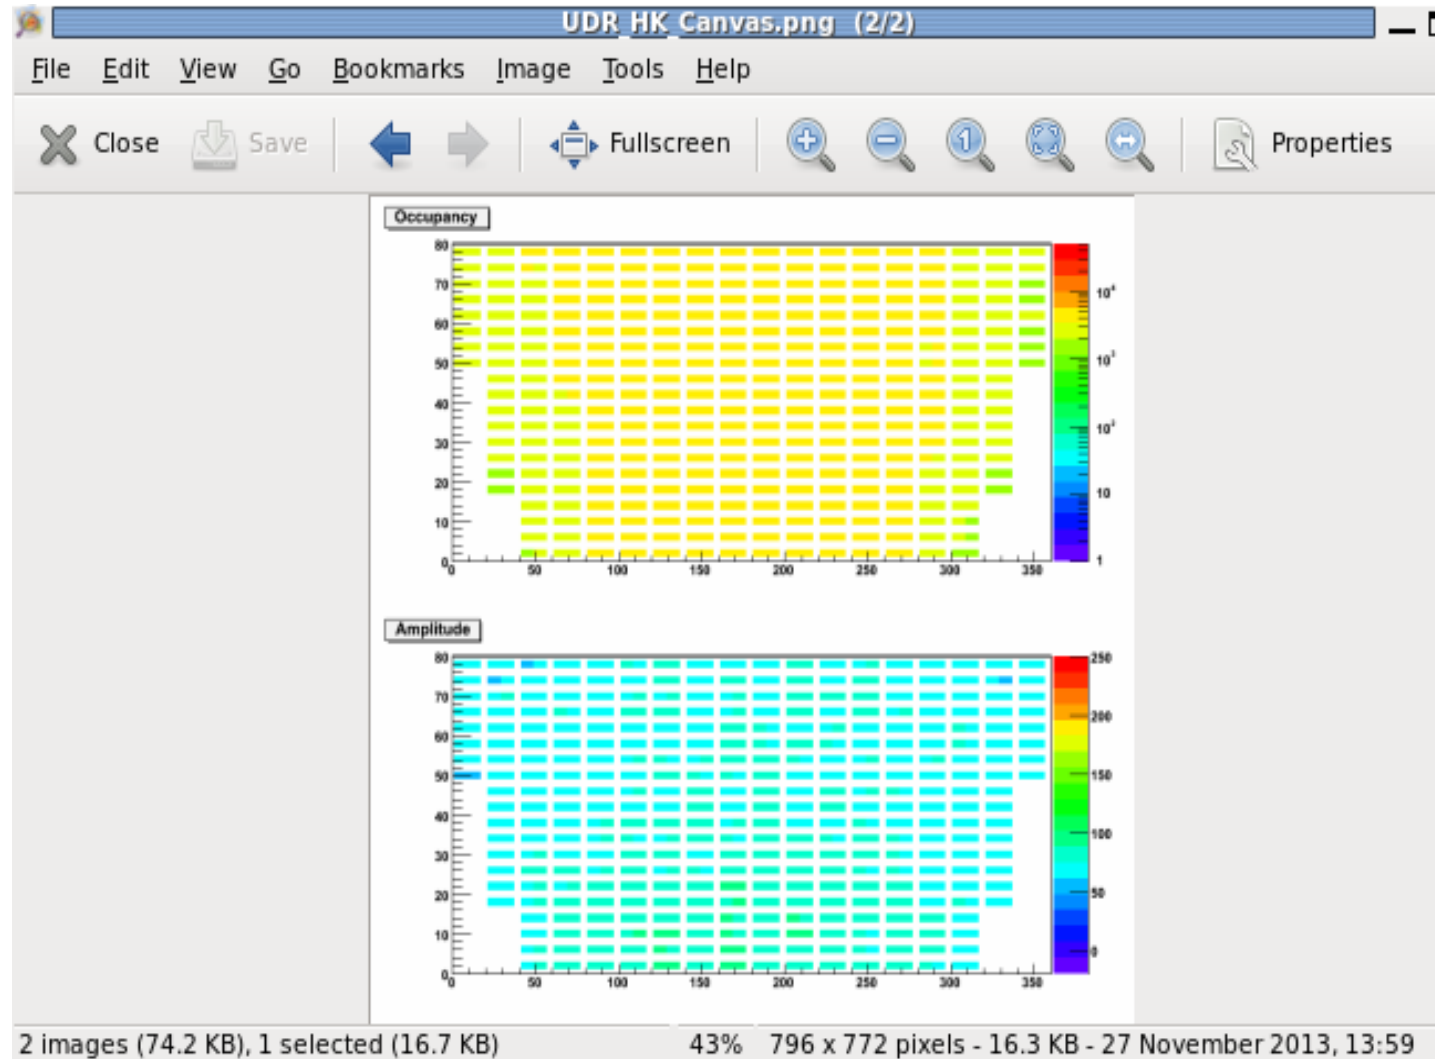

Also check:

Upper: Actual Occupancy (number of hits in each of the 5248 straws)

Lower: Actual Amplitude (Median, Pedestal corrected) values in ADC channels for each of the 5248 straws

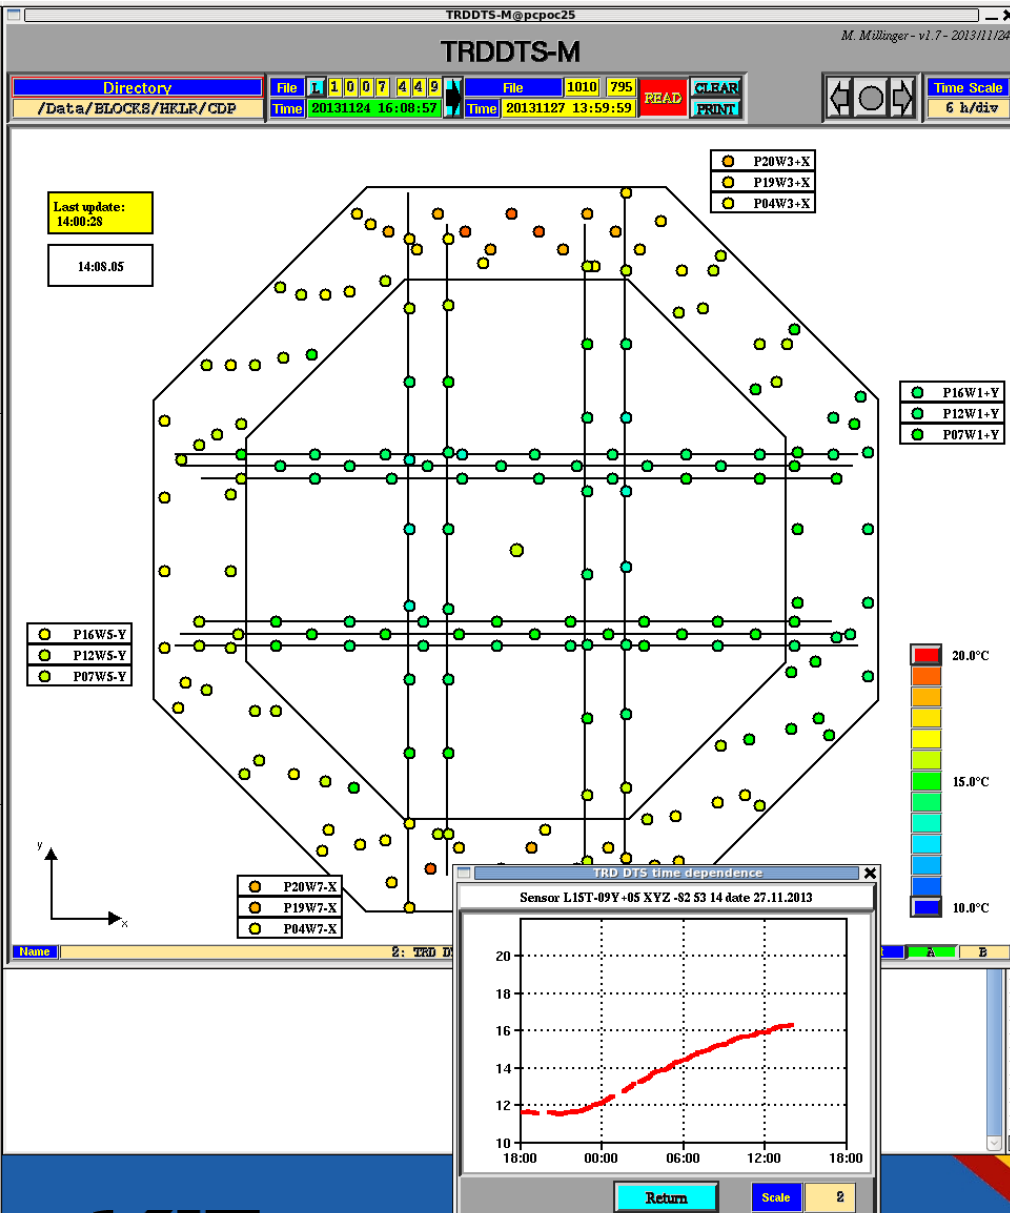

To Check:

- Occupancy plot should not show any unusual high or low channels
- Amplitudes should be fairly homogenous

If the pattern looks very inhomogeneous (i.e. during SAA), wait for a new calibration (every equator crossing). If it still looks bad, ask LEAD if the calibration times in the TQ list matches the OSTPV (more than 1 minute difference can cause bad calibrations). If this is not a problem, email the trd experts and attach a screenshot

TRDDTS-M: TRD Checklist Section 4

Also check:

A total of 404 Dallas Sensors are read out on 40 strips are read out by USCM-UG-A/B (202 sensors – 20 strips – 7 busses respectively)

The Label contains Layer-Number L01..L20, Tower-Number T-9..T+9 and position along chamber in decimeters [XY]-10..[XY]+10

Some sensors are located outside the octagon volume. For those sensors the naming scheme is as follows: Layer-Number P01..L20, Wall-Number W1..W8 (W1 = +X, W3=+Y, W5=-X, W7=-Y, Wall-Half[+][XY])

If there is a problem or question about heaters turning on or not, see pgs 87-90 in the full guide.

High Voltage Adjustment: TRD Checklist Section 5

5. High Voltage Adjustment (with TRD experts only, once per day)				
HV Adjustment?	Y: <input type="checkbox"/>	N: <input type="checkbox"/>	How much?	<input type="text"/>

If you are a TRD shifter (i.e. not a Tracker shifter), you should do a high voltage adjustment once per day (see TRD Procedures section—the pink tab—in the full guide).

If not, check the box next to “No” unless a TRD shifter tells you otherwise.

Laser Calibration: TRD Checklist Section 6

6. Laser Calibration (with TRD experts only, once per day)

If there is no TRD HV adjustment in your shift, please ignore this item.

Check for the following in the TAS Status Monitor error window: (Check against pg 55 in guide book)	Number Of High Power Laser Run = 10	Y: <input type="checkbox"/> N: <input type="checkbox"/>
	Number Of Low Power Laser Run = 10	Y: <input type="checkbox"/> N: <input type="checkbox"/>

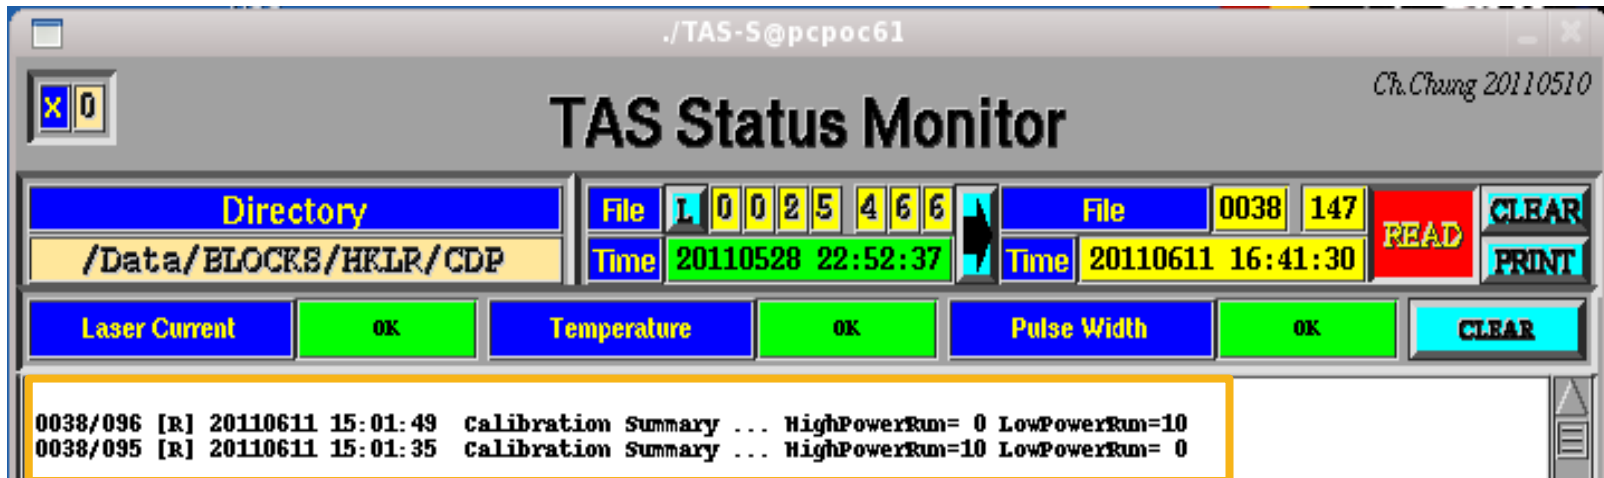

If either of these answers is "No" put a note in the elog and *email* the expert on call.

During the High Voltage adjustment, LEAD will start the TAS calibration run. Normally it will finish without problems, in which case you will see the number of High and Low Power Runs both = 10, as shown below in the TAS Status Monitor.

If **BOTH** of these do not show up within ~20 minutes, ask LEAD if they ran the TAS calibration during the HV adjustment.

If **ONE out of TWO** of these does not show up within ~ 20 minutes, notify LEAD and ask if there was a problem during the TAS run. They should check for the line "TAS Run Completed Successfully" on their JMSG monitor.

THIS IS NOT AN EMERGENCY. If we miss the TAS run one day, it's OK. But we **do not want to skip it two days in a row.** So if one or both runs are missing make sure you email the local experts and TAS expert C. H. Chung: tell them one got skipped, include a screenshot.

Laser Calibration: TRD Checklist Section 6

6. Laser Calibration (with TRD experts only, once per day)

If there is no TRD HV adjustment in your shift, please ignore this item.

Check for the following in the TAS Status Monitor error window:
(Check against pg 55 in guide book)

Number Of High Power Laser Run = 10

Y: N:

Number Of Low Power Laser Run = 10

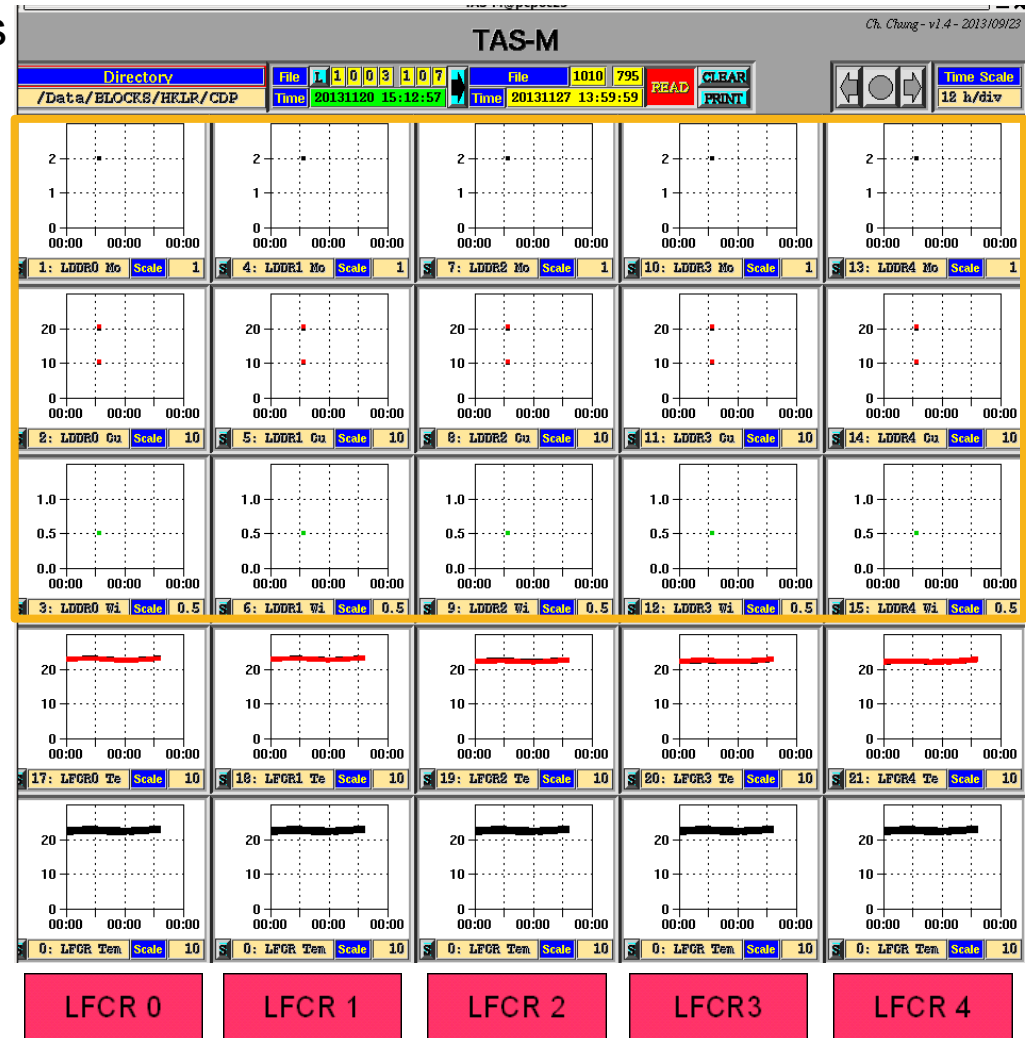

Y: N:

If either of these answers is "No" put a note in the elog and *email* the expert on call.

Also check: did you get new data points in the TAS Monitor with the TAS run. You will see the new points like we show on the **right**: they should be consistent (relatively constant) with the previous data points.

Furthermore, the bottom 10 plots should be relatively constant.

If you notice something wrong, **email** the local experts—be sure to attach a screenshot.

Operation Mode
0: Int, 1: Ext-A, 2: Ext-B
Default = 1 or 2

Laser Currents
Default = 20 & 10 mA

Laser PulseWidth
Default = 0.5 us

Diode Temperatures

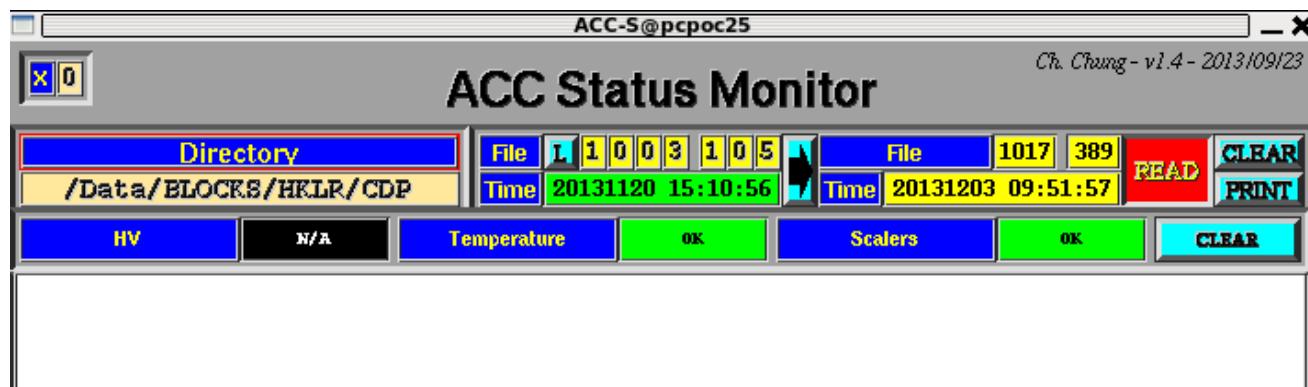

Fill Out Your ACC Checklist!

ACC Status Monitor: ACC Checklist Section 1

1. ACC Status (ACC-S): if either temperatures or scalers are red, call expert.					
Temperatures	Check if the corresponding boxes are green (= OK)				
Scalers					

If any box turns **red**:

- (1) Check the elog: is there a note from an expert?
- (2) If there is no note and it does not turn **green** after ~25 minutes of AOS, put a screenshot of BOTH the ACC Status Monitor AND the ACC desktop on the elog and call the trd oncall expert.

ACC-M: ACC Checklist Section 2

2. ACC housekeeping Monitoring (ACC-M): if HV changes, call the expert

Pedestal Positions stable		
HV settings ok? (p.37 TRD/ACC/TAS docu.)		
Thresholds LT/HT/SHT @ 25		
Scaler S0 & S1: >0 and < 20K (orbital variat.)		
Scaler S2 & S3: >0 and < 30K (orbital variat.)		
Temperature PMT W+/W-/R+/R- in operational range (-30°C to +45°C)		

Stable

Follow the checklist down through the plots. If anything is out of range (except for SAA):

- (1) Check the elog: is there a note from an expert?
- (2) If it's HV, talk to TOF (PM Shift): is there something going on?
- (3) If there is no note and it does not return to normal after ~25 minutes of AOS, put a screenshot of the ACC desktop on the elog and call the trd oncall expert.

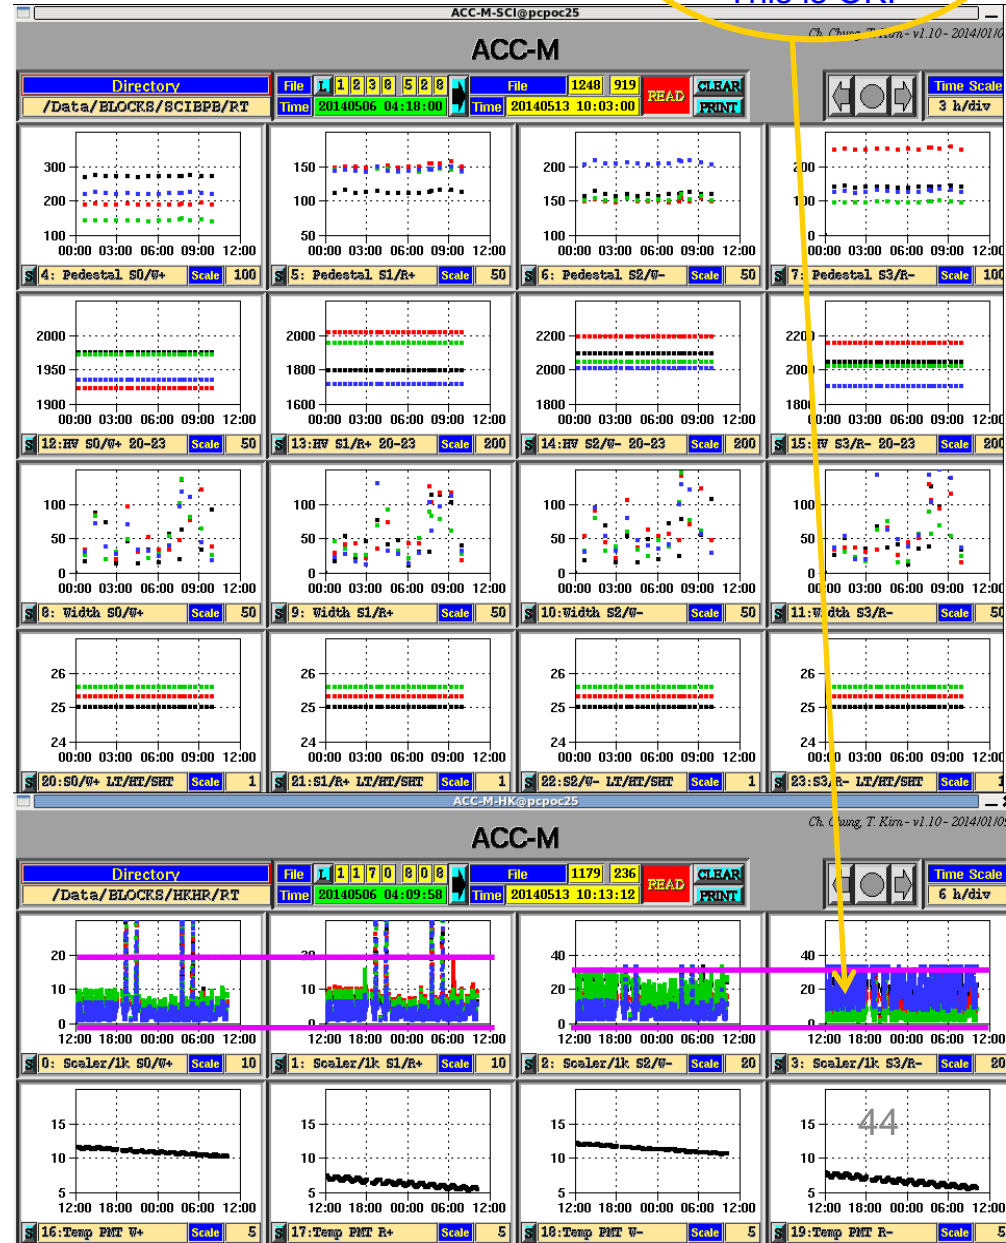

Stable at correct settings (see pg. 37 of full guide)

Stable at 25

The magenta lines are the limits

-35 to +45 deg

The linear regulator for the S3 blue line is broken, so this is often a bit too high. This is OK.

ACC-data-M: ACC Checklist Section 3

3. ACC Data-Monitor (ACC-data-M): if any sector (ACC 0-7, plots 14 and 15)

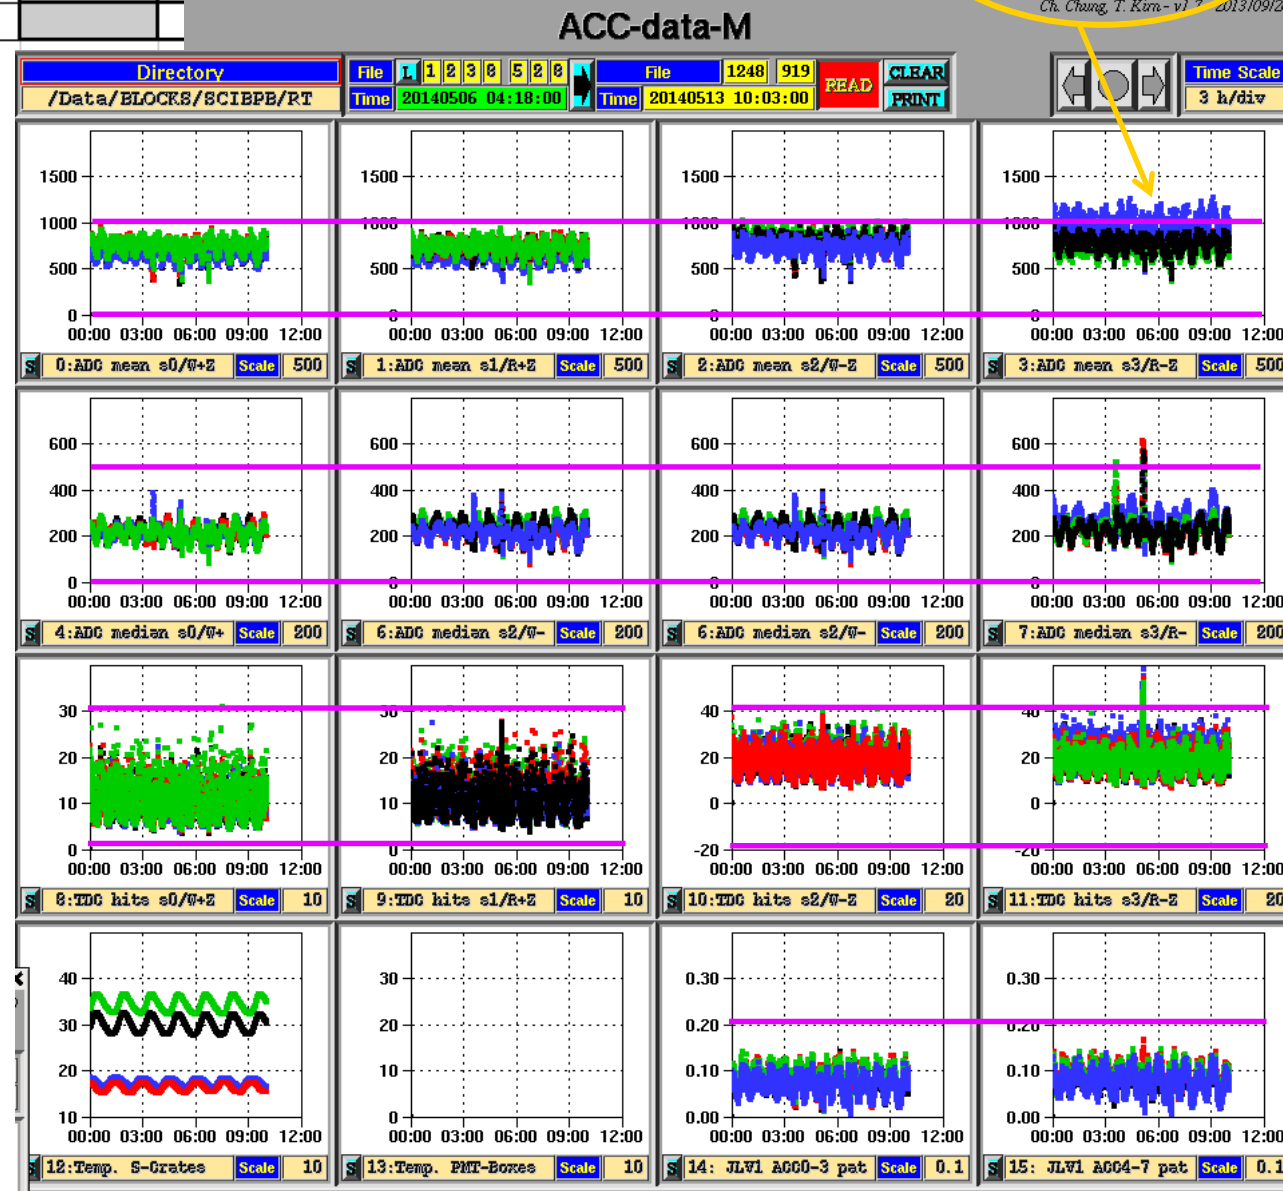

ADC Mean values >0 & < 1000 (orbital variat.)	
ADC Median values >0 & < 500 (orbital variat.)	
TDC Hits S0 & S1: >0 & < 30 (orbital variat.)	
TDC Hits S2 & S3: >0 & < 40 (orbital variat.)	
JLV1 ACC0-7 pat < 0.20	

The magenta lines are the limits

The linear regulator for the S3 blue line is broken, so this is often a bit too high. This is OK.

Follow the checklist down through the plots. If anything is out of range (except for SAA):

- (1) Check the elog: is there a note from an expert?
- (2) Talk to TOF (PM Shift): is there something going on?
- (3) If there is no note and it does not return to normal after ~25 minutes of AOS, put a screenshot of the ACC desktop on the elog and call the trd oncall expert.

Ch. Chung, T. Kim - v1.7 2013/09/24

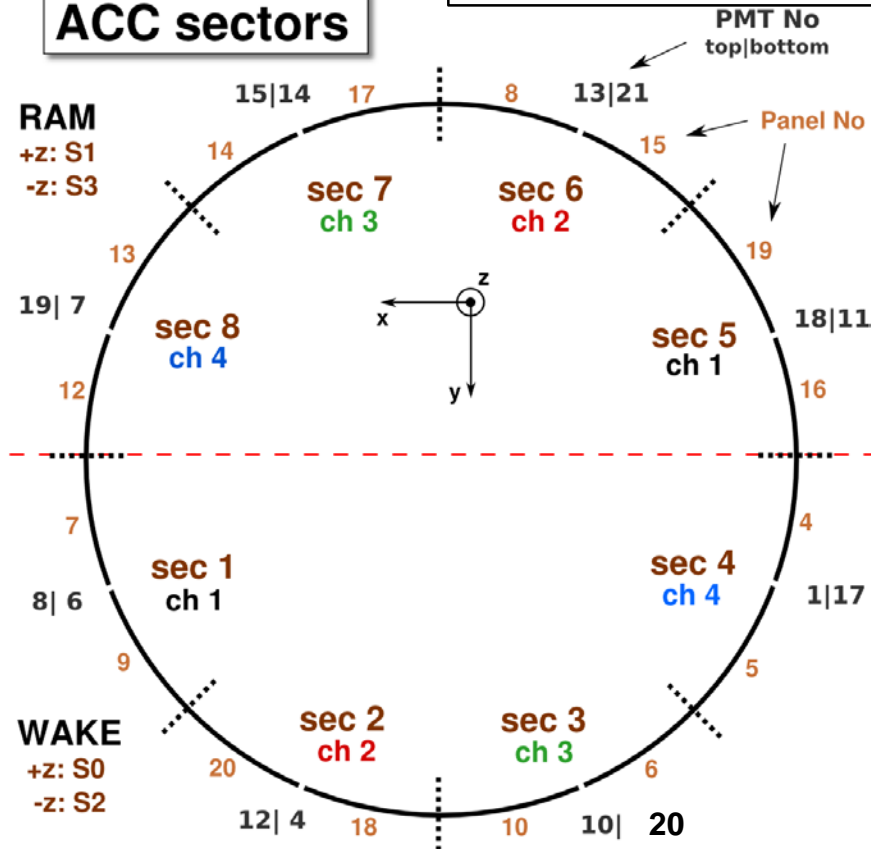

ACC-System

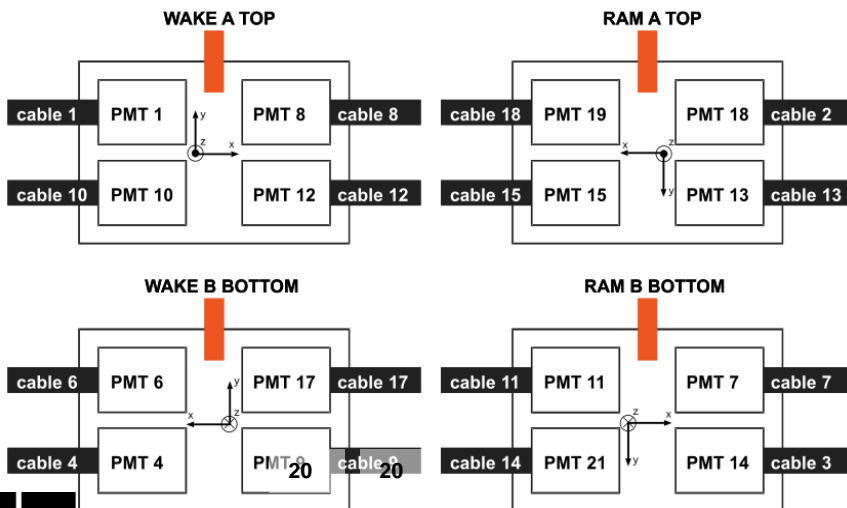

ACC-System

ACC sectors

- ACC is mounted inside PM surrounding inner tracker planes to serve as a veto.
- ACC consists of 8 cylindrical sectors with a radius of 55 cm from the center of Z-axis, 83 cm in height and readout by 16 PMTs. Each sector is composed of two scintillator panels optically linked to upper one and lower one PMT.
- Upper and Lower 4 x 4 PMTs are grouped and housed into 4 PMT boxes (2 x Wake $\pm Z$, 2 x RAM $\pm Z$) mounted on vacuum case.
- Charge threshold is set the same 25 ADC in all LT/HT/SHT values.
- Monitor calibration (pedestal and its width), configuration (HV, threshold, ..) and scaler from JLV1 status
- Monitor ADC and TDC during DAQ

1. ACC Status Monitoring (ACC-S)

Check HV, Temperature and Scaler with operating ranges

2. ACC Housekeeping Monitoring (ACC-M)

JLV1 Scaler, ACC Calibration (Ped, Width), ACC Configuration (HV, Trigger Threshold)

3. ACC Data Monitoring (ACC-data-M)

ACC-trouble shooting

S2 WAKE -Z

Issue: Scaler too high (saturates at 32k): Check if ACC HV or thresholds have changed. If not ask TOF expert/LEAD if trigger configuration has been modified. If not, possible the PMT became noisy.

CALL TRD and ACC Experts (TRD phone and Thomas Kirn and Chan Hoon Chung) they will check the corresponding ADC. You will work with TOF expert to lower HV if necessary.

ACC-trouble shooting

Issue: stepwise scaler increase.

In this case it was due to change in HV settings which you can see in the HV plots. But if HV is the same, check with TOF expert to see if something (like trigger config) has changed.

If scaler at zero:

HV could be off (check HV plot and check with LEAD and TOF)
 If HV is on, should also see the ADC mean and median plots and the JLV1 ACC pattern for this sector should all go down to 0.
 HV channel could be broken. This can only be checked by TOF- and ACC-experts

No data taking, HV off, PMT dead, cross check with ACC-S!

Contact ACC-Expert, AMS-LEAD, TRD/ACC/TAS expert on call

ACC-trouble shooting

Temperature below operational range → Turn HV off!

This can happen if it gets too cold, but has not happened in space (yet)

Turn of HV of affected PMTs. This needs to be coordinated with TOF experts as soon as possible. Inform TRD on-call and ACC experts Th. Kirn and C.H. Chung

Laser Alignment (TAS)-System

5 x LBBXs

5 x LFCRs

5 x LBBXs

$$\lambda = 1082 \text{ nm}$$

$$\Delta t_{\text{pulse}} = 0.5 \mu\text{s}$$

$$I = 15 \text{ mA (max 140 mA)}$$

$$T_{\text{transmittance}} = 40\text{-}45\%$$

- Laser system is controlled by 5 laser driver boards integrated in the M-Crate
- Laser system is divided into 5 laser couplers (LFCR) housing each two laser diodes and 5 laser beam port boxes (LBBX) mechanically mounted on the top of tracker plane #2.
- Each LBBX delivers 4 laser beams injecting perpendicularly through 7 layers of inner tracker.
- Laser calibration is designed to be run by LEAD every time the TRD HV is adjusted, ~once per day.

5 x LFCRs

1. TAS Status Monitoring (TAS-S)

Check Laser current, LFCR Temperatures, Laser Puls Width

2. TAS Housekeeping Monitoring (TAS-M)

Check LFCR operation mode, Laser currents, Laser Puls Width, Diode Temperatures

TAS Calibration Sequences
(total 20 diode runs)

10 diodes with 20 mA
10 diodes with 10 mA

one each time a HV adjustment is performed

TAS-Monitoring Program: TAS-M

TAS-M@pcpoc61

TAS-M Ch. Chung 20110415

Directory: /Data/BLOCKS/HRLR/CDP

File: L0027001 File: 0038 148 READ CLEAR

Time: 20110530 19:28:40 Time: 20110611 16:42:29 PRINT

Time Scale: 1 day/div

Operation Mode
0: Int, 1: Ext-A, 2: Ext-B
Default = 1 or 2

Laser Currents
Default = 20 & 10 mA

Laser PulseWidth
Default = 0.5 us

Diode Temperatures

LFCR 0

LFCR 1

LFCR 2

LFCR 3

LFCR 4

Out of Current/Width Range
($I = 10 - 20 \text{ mA}$, $w = 0.5 \text{ us}$)

Out of Temperature Range
Nominal 0°C to 30°C

20 Diodes Runs / TAS Run
10 x 20mA + 10 x 10mA Runs

Ask LEAD not to perform any TAS calibrations, then check TAS Configuration: (TAS Config: https://ams.cern.ch/AMS/DAQ/ams02_cmds/TAS/TAS_20runs.txt)

Ask LEAD to check status of TRD Heaters (PDS) and then request no more TAS runs until temperature comes back within operating range.

Report to LEAD about missing runs. If all ok, watch TAS run for next day. If problem repeats contact TAS experts.

In case of problems
make an entry in elog.

Set to current directory and file

Use to check single channel HV values for A/B-Side

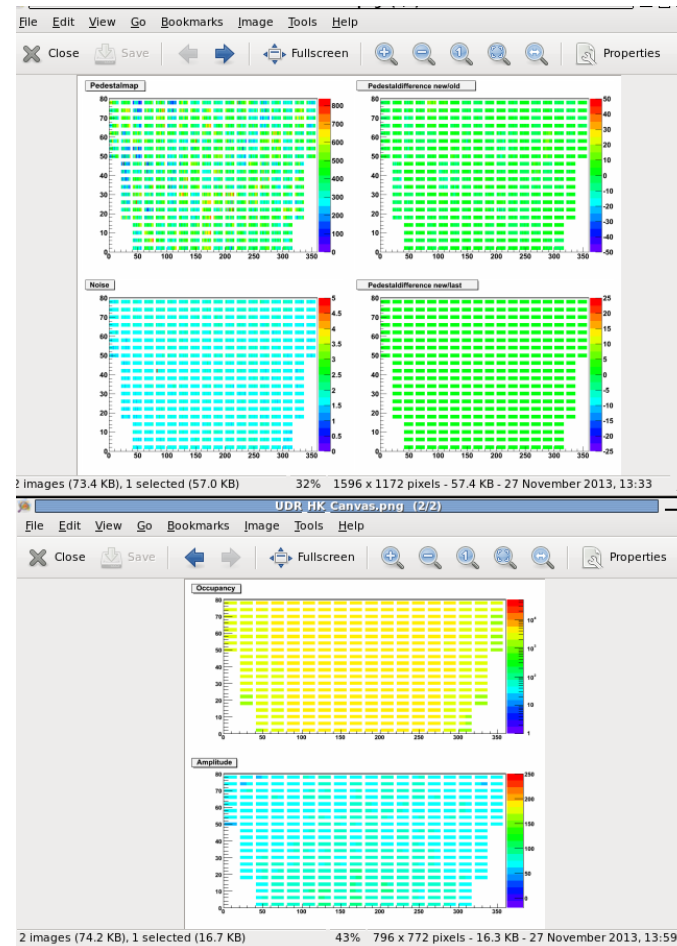

Configuration of Pedes- & UDR_HK-Canvases

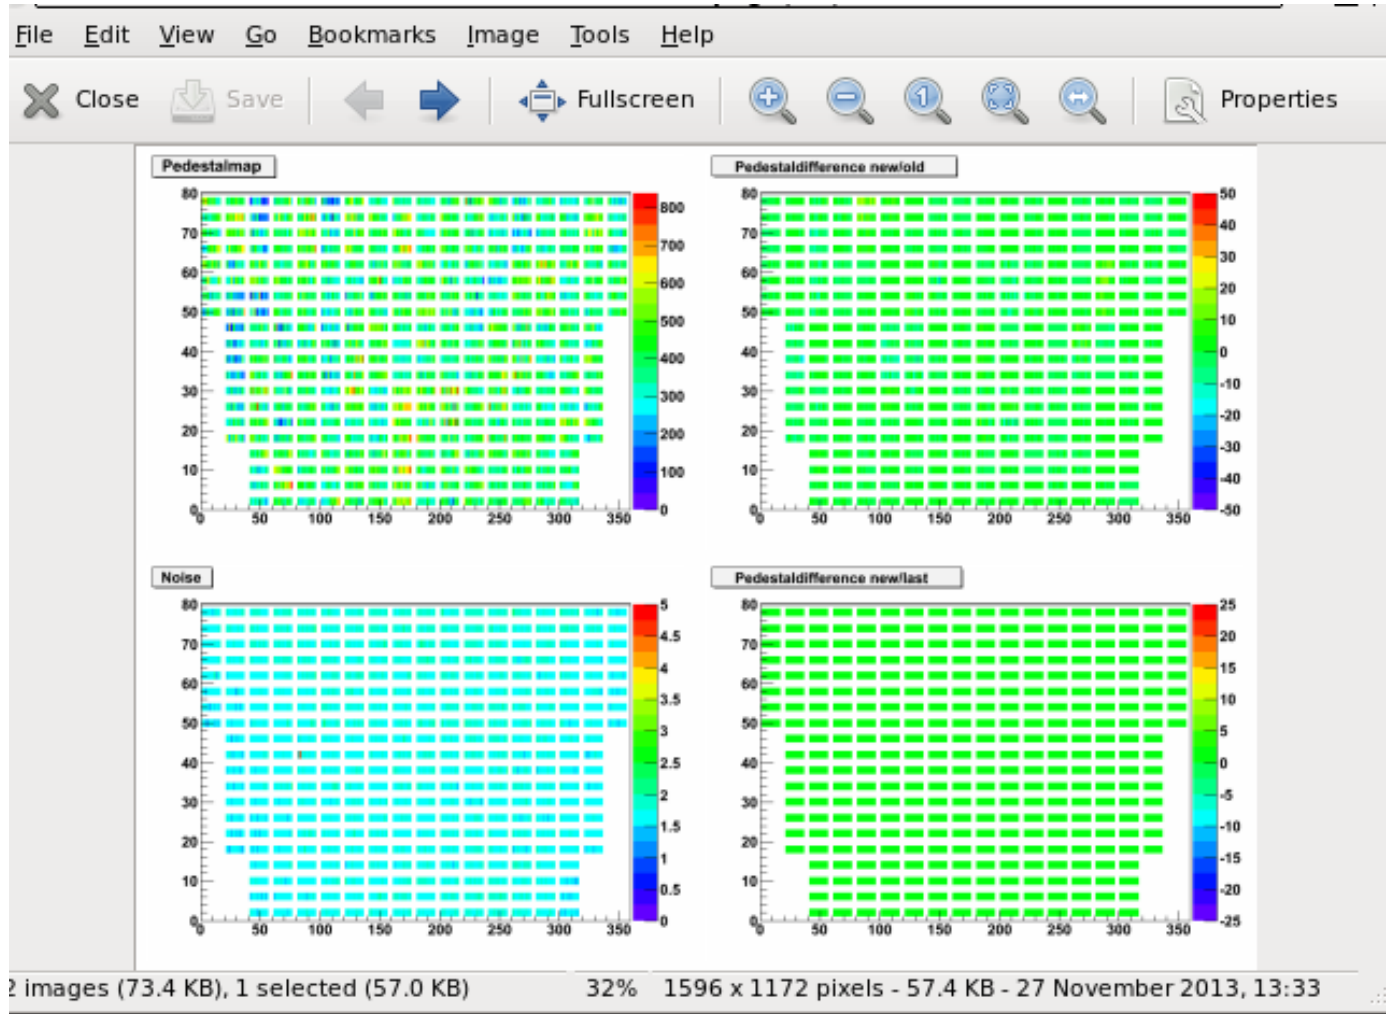

In xterm of TRD-S:

```
[ RUN]$ ctrl-z  
[ RUN]$ bg  
[ RUN]$ xdotool search -name TRD-S-HK type -window %1 'watch -n 60  
`gthumb ~trd/RUN/OUTPUT/TRD-S/Pedes_Canvas.png` &  
[ RUN]$ xdotool search -name TRD-S-HK type -window %1 'watch -n 60  
`gthumb ~trd/RUN/OUTPUT/TRD-S/UDR_HK_Canvas.png` &
```

Place as shown on screen-1 layout

Calibration of each of the 5248 Straw-Tubes

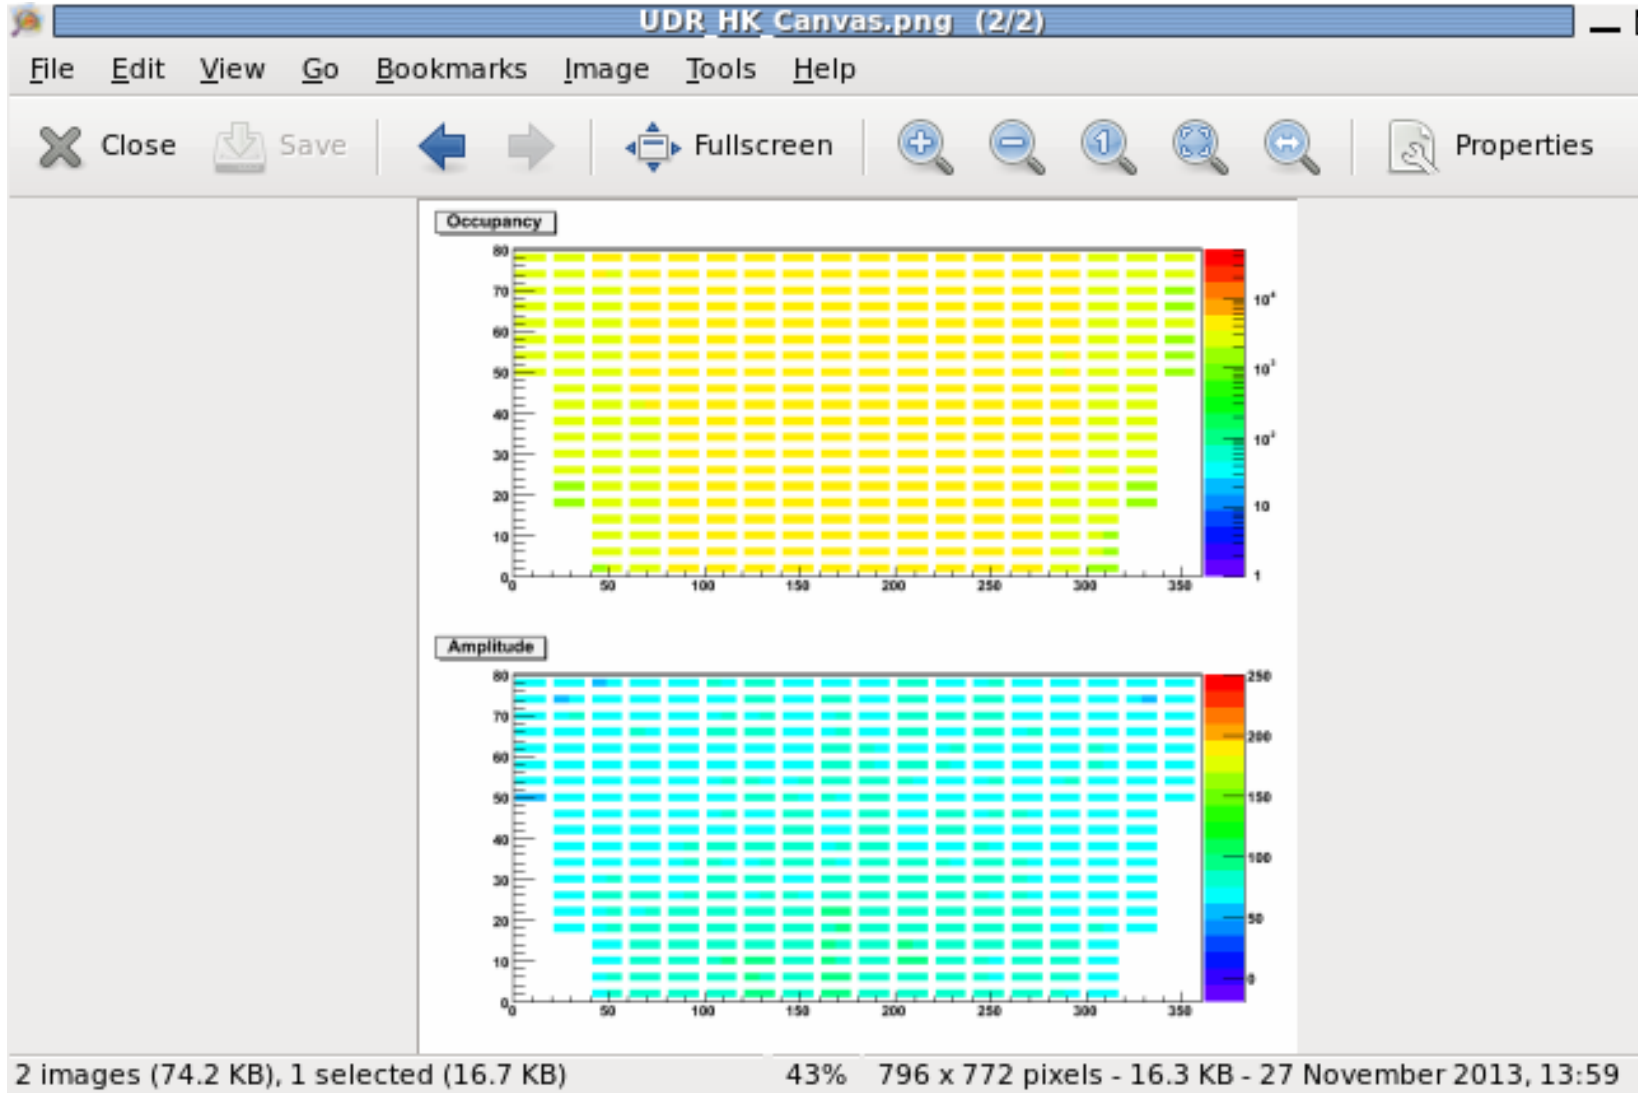

Upper left: Actual Pedestal values in ADC channels

Upper Right: Difference between actual and default Pedestal values

Lower Left: Actual Noise values in ADC channels

Lower Right: Difference between actual and last Pedestal values

Noise should show usual pattern
(all but 2 channels green for A-Side Power,
also slightly higher noises on end/front of segment for B-Side Power)

Upper: Actual Occupancy (number of hits in each of the 5248 straws)
 Lower: Actual Amplitude (Median, Pedestal corrected) values in ADC channels for each of the 5248 straws

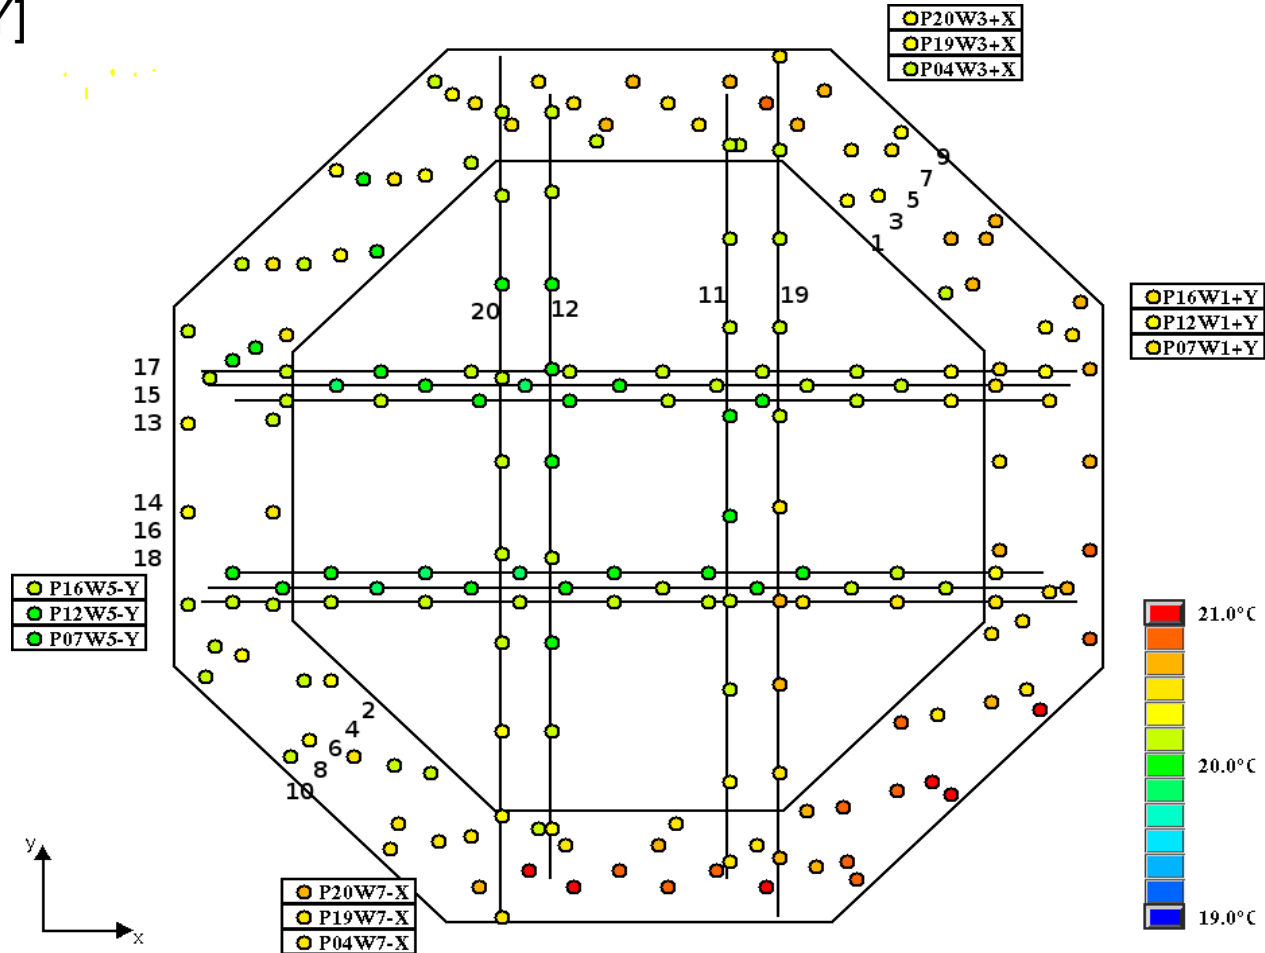

- Occupancy plot should not show any unusual high or low channels
- Amplitudes should be fairly homogenous

TRD-DTS Monitor – TRDDTS-M

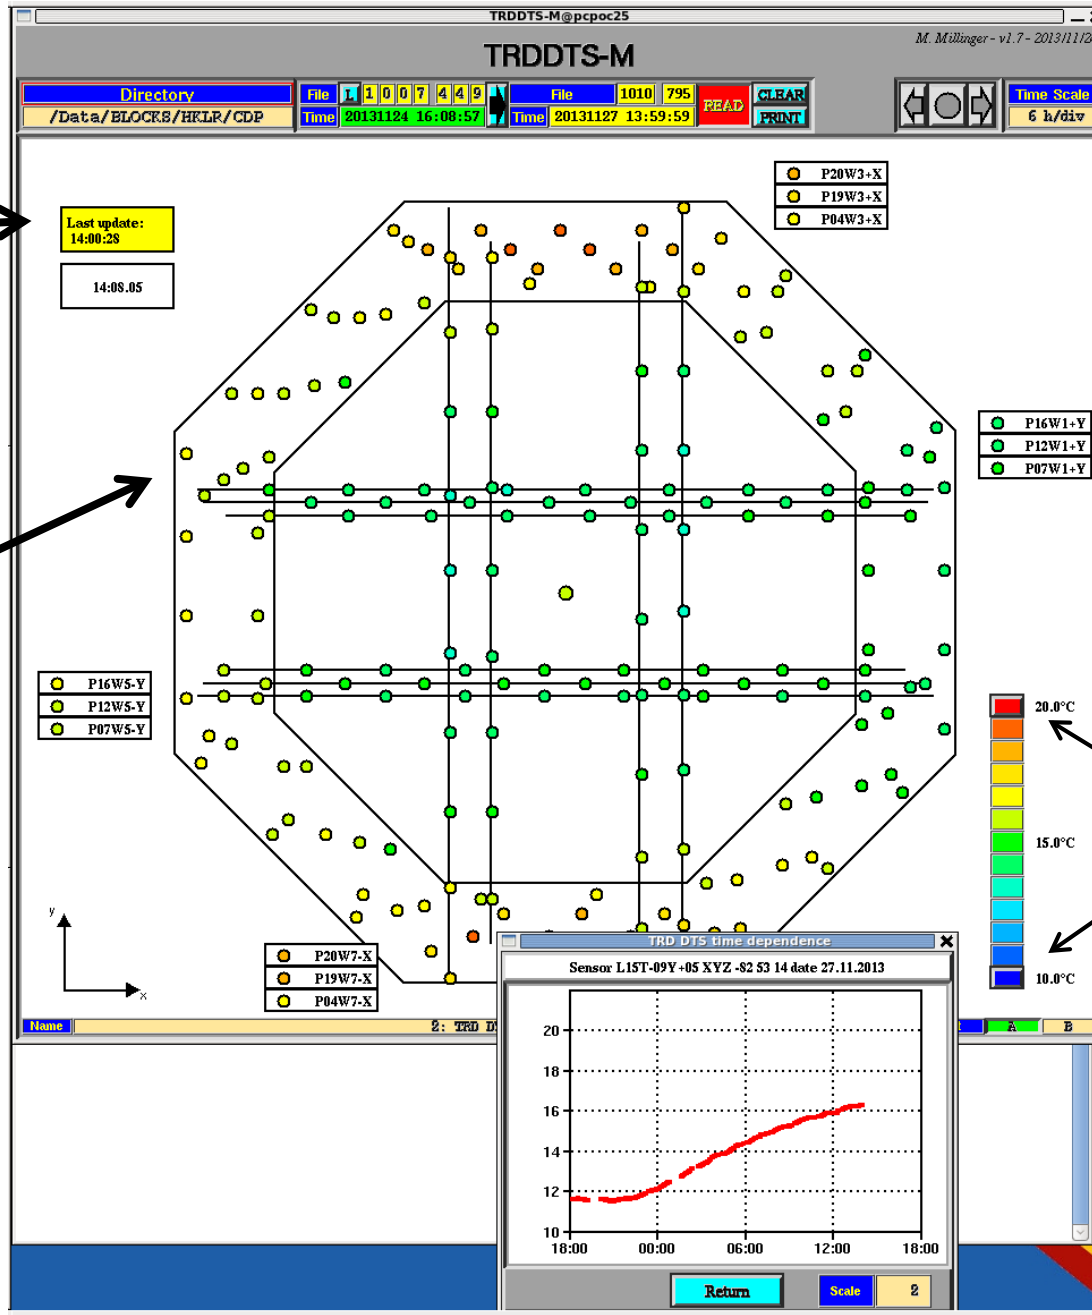

A total of 404 Dallas Sensors on 40 strips are read out by USCM-UG-A/B (202 sensors – 20 strips – 7 busses respectively)

The Label contains Layer-Number L01..L20, Tower-Number T-9..T+9 and position along chamber in decimeters [XY]-10..[XY]+10

Some sensors on the strips are located outside of the octagon volume (near the connector patch-panel). For those sensors the naming scheme is as follows: Layer-Number P01..L20, Wall-Number W1..W8 (W1 = +X, W3=+Y, W5=-X, W7=-Y, Wall-Half[+-][XY]

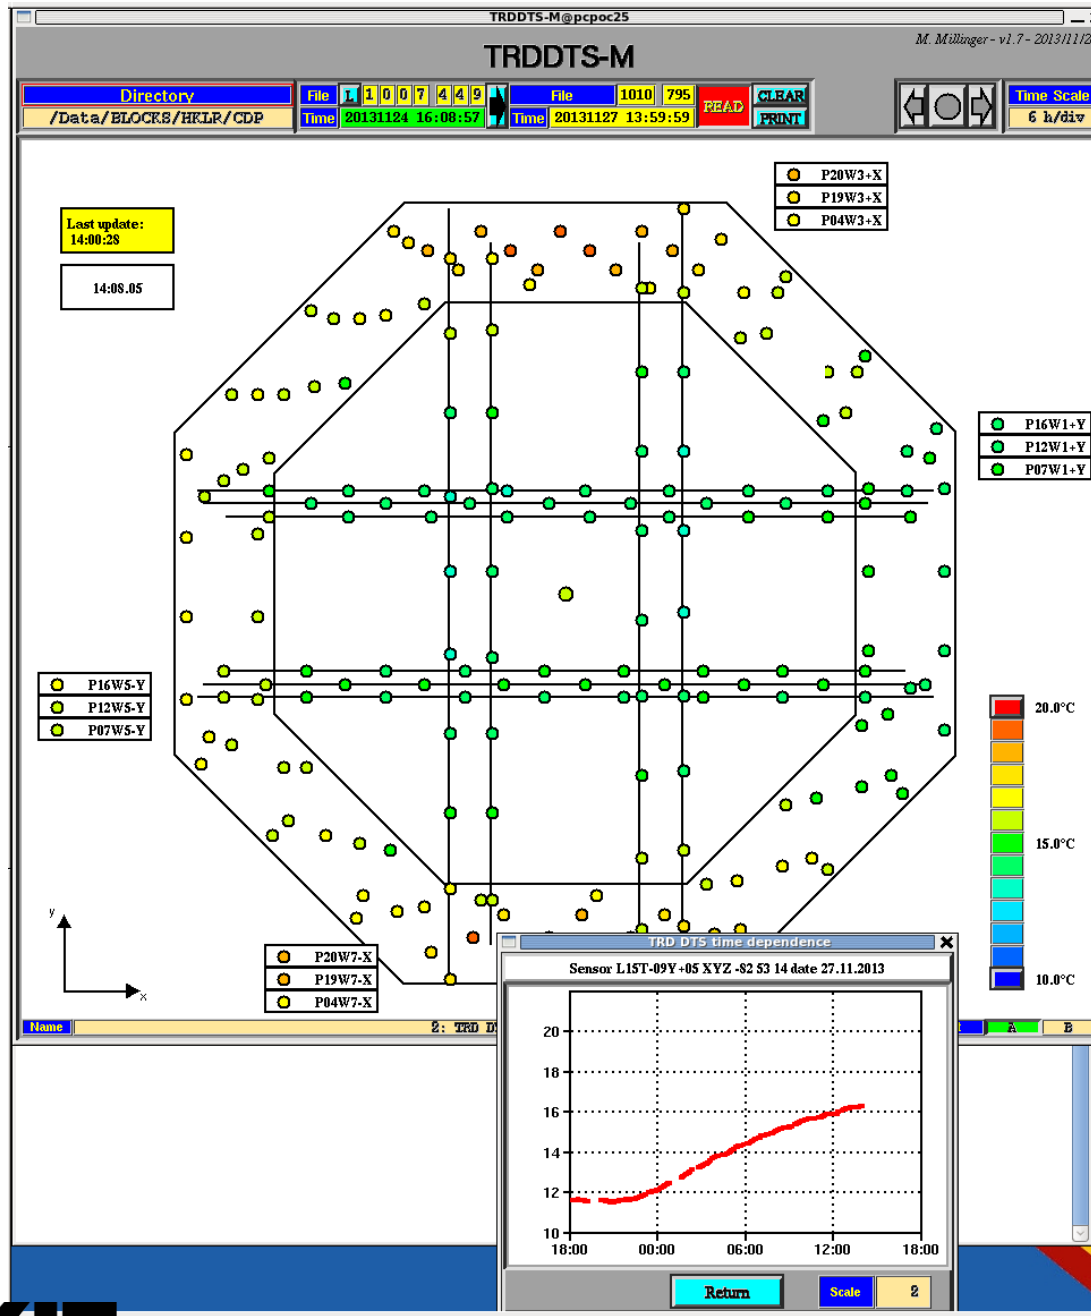

Time of last update

Change color range

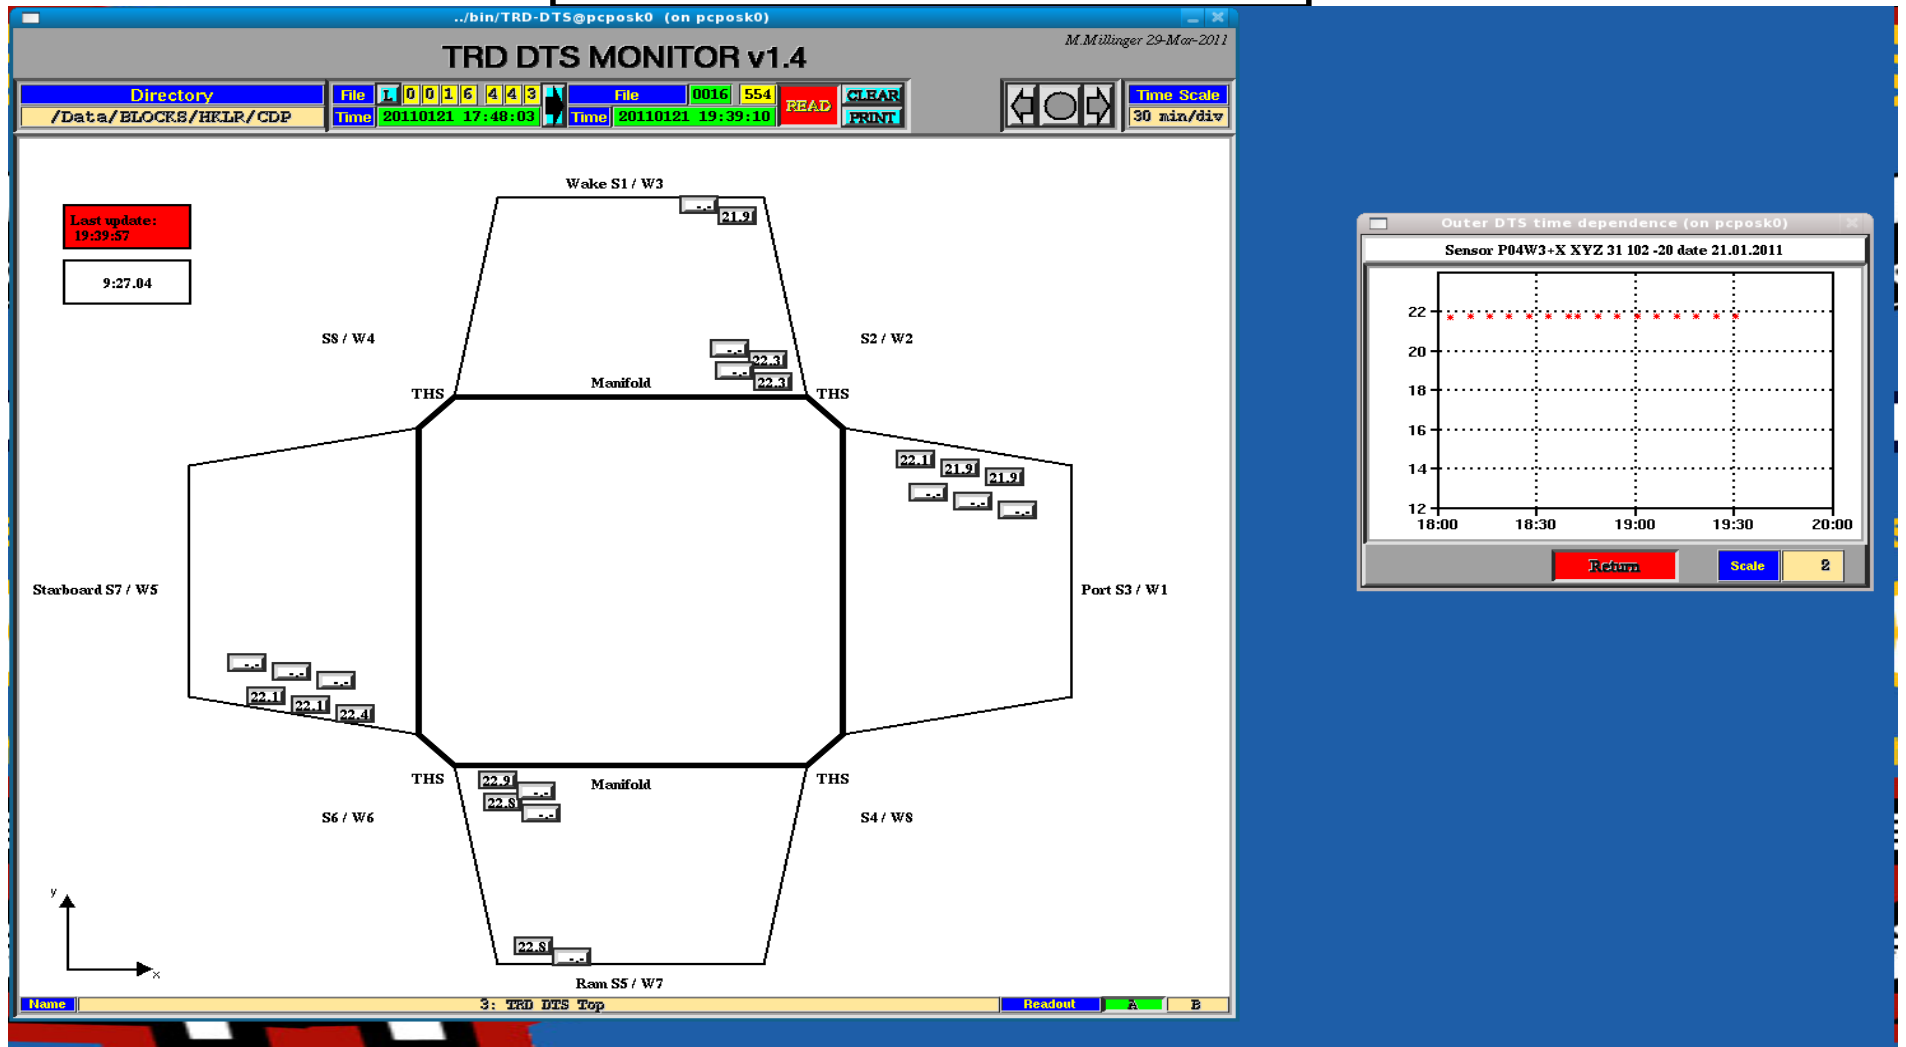

On any sensor:
Left click -> get sensor information
Right click-> get histogram of sensor temperature (close histogram again using the 'Return' button!)

- Each button represents the approx. location of 1A & 1B sensor
- A left-/right-click on a button shows detailed information/ Temp.history of the sensor
- ‘Last update’ supposed to stay green in ‘Read’-mode
- Color palette adjustable left-/right-click on max or min button increases/decreases respective limit by 1
- On bottom right the active readout side is shown – in case both readouts are available one can select which one shall be displayed
- Different views available (click on ‘Name’ button on bottom)

TRD-DTS: 'Top view'

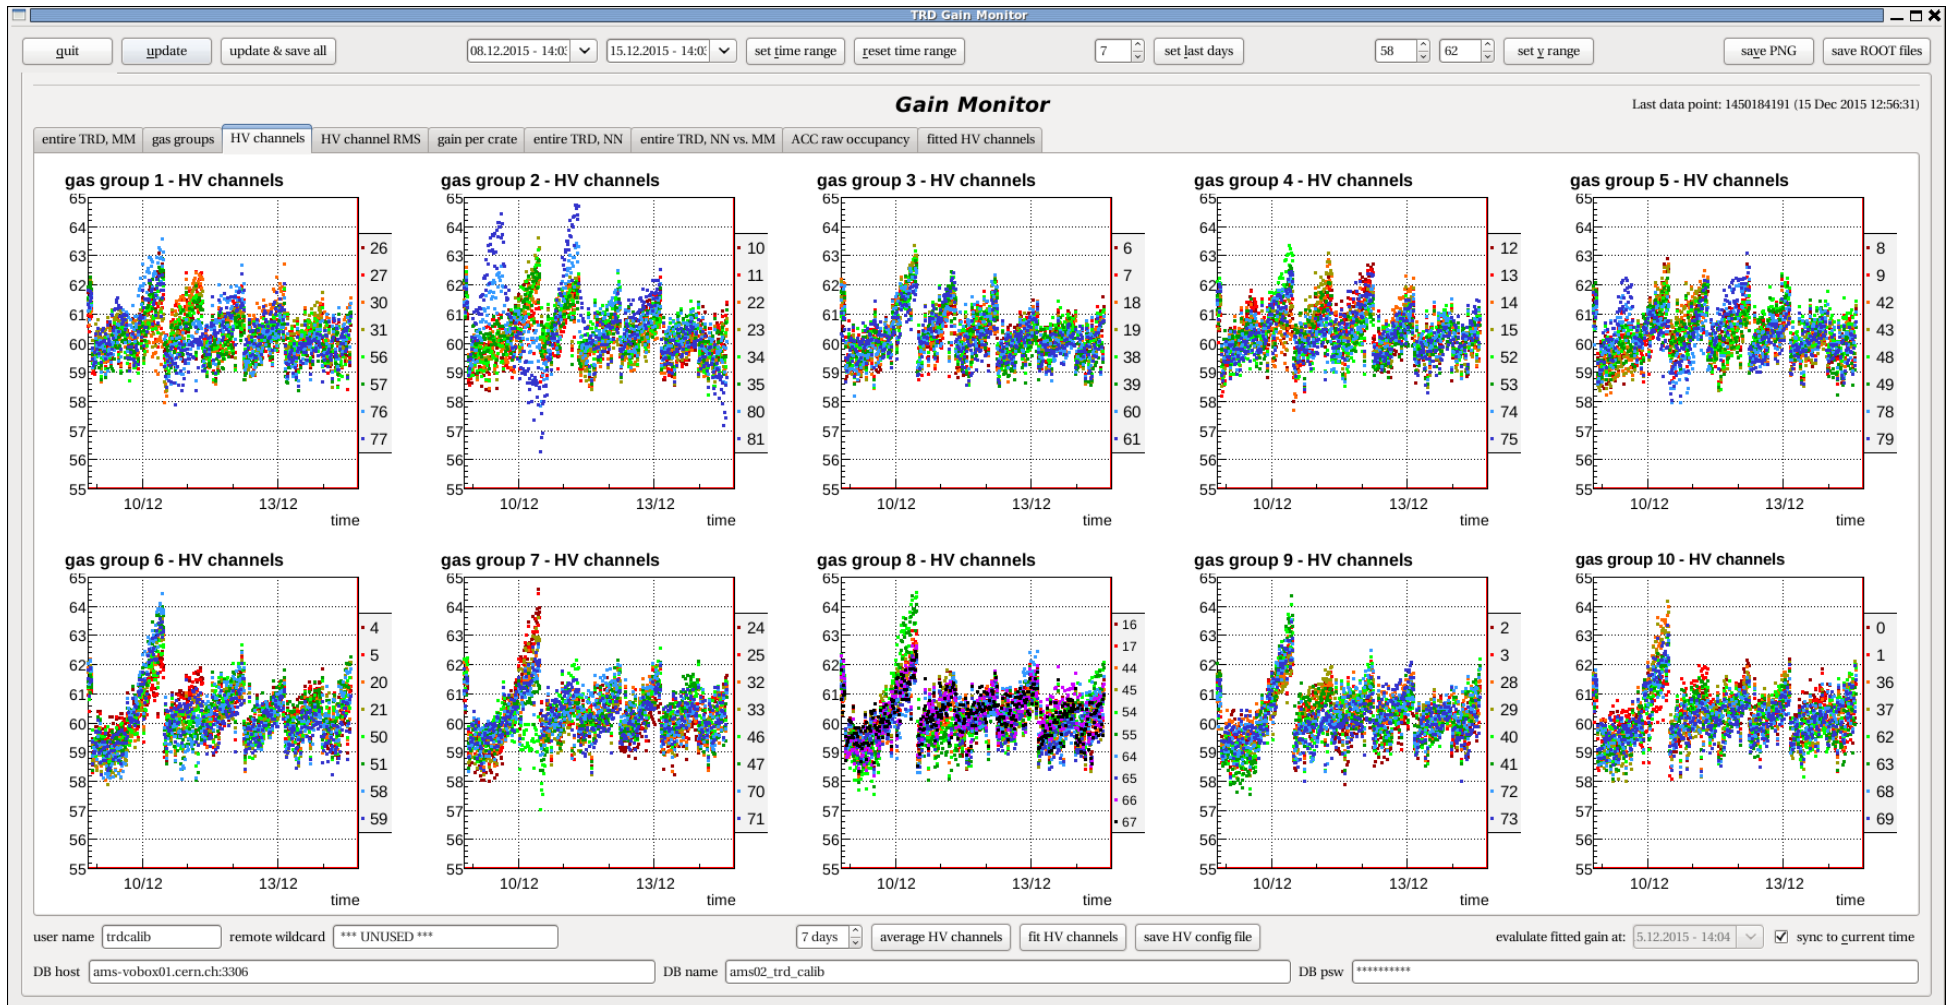

- Selectable by clicking 'Name' button on bottom line
- Schematic display of the position and temperature of sensors outside the TRD volume, the naming convention for the TRD side elements, the TRD Gas manifolds and the position of the TRD M-structure heaters (THS)

Same 'user interaction' functionalities as other view(s)

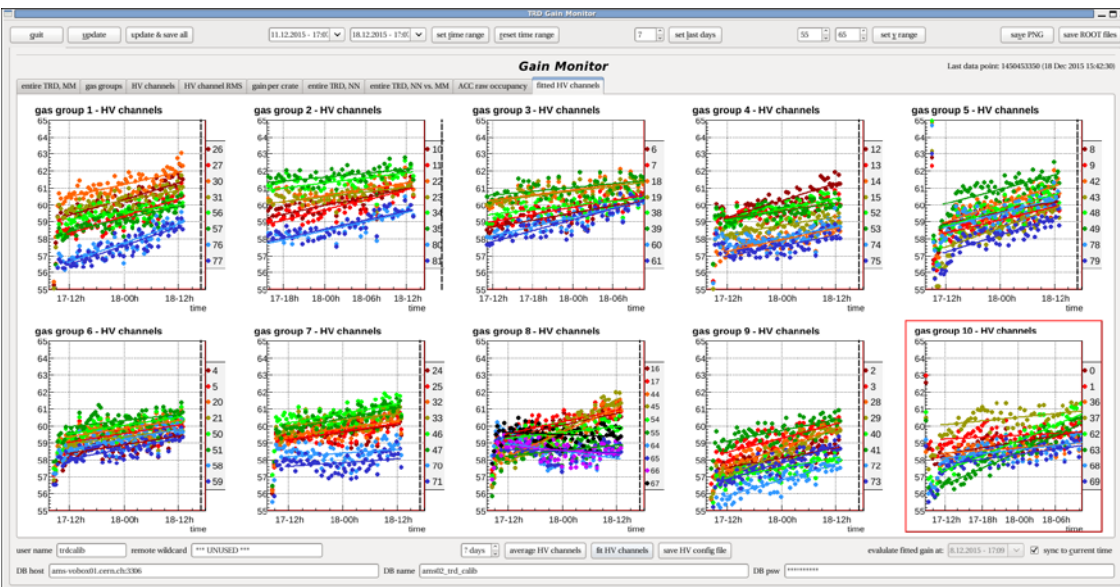

TRD Gain Monitor:

The high voltages of the individual HV-channels (4 straw modules) are monitored.

TRD Gain Monitor:

The new standard daily HV-adjustments are fitted with the program using the individual HV channels to do an intercalibration. If only an overall adjustment is possible then the average gain of the entire TRD is used.

Gain Monitor:

The HV of the TRD has to be adjusted every day to minimize the gas gain variations. The MOP should be at about 60 ADC counts.

For checking the evolution of the TRD signal gain, open a terminal, go to RUN directory and open program:

```
cd ~trd/RUN
TRD-GainMonitor
```

Take care that you do not hit any key afterwards (causes hang-up)
Be patient, especially when you ask for updating.

Gain Monitor:

The evolution of the TRD signal gain is determined via two different methods:

Millinger Gain: Using std-version of AMS-ROOT-files in SOC (late by ≈ 1 h)

this method is used to determine the overall daily HV adjustment

Nikonov Gain: Using 1-Minute-ROOT-files (late by ≈ 1 h)

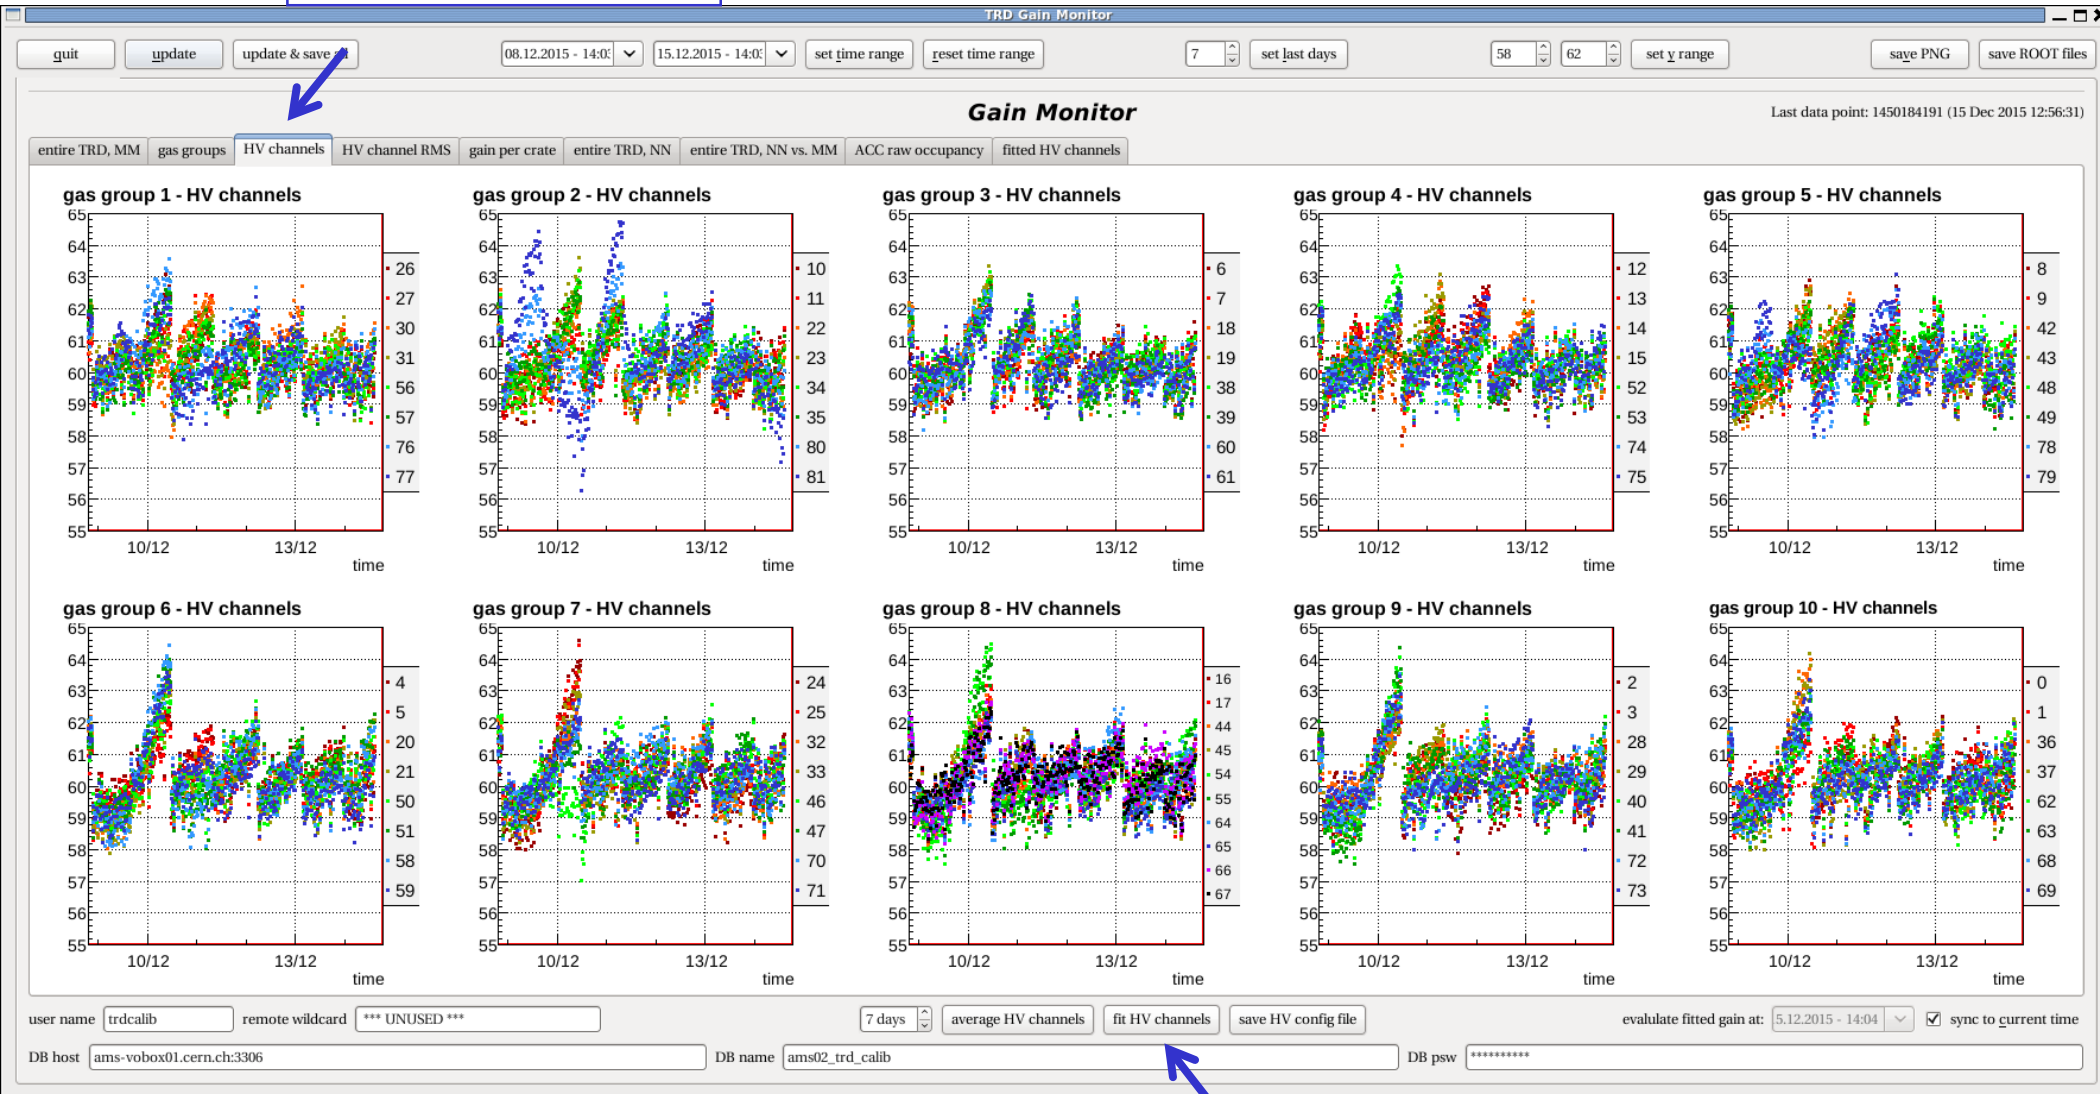

TRD-GainMonitor

Click on update gains

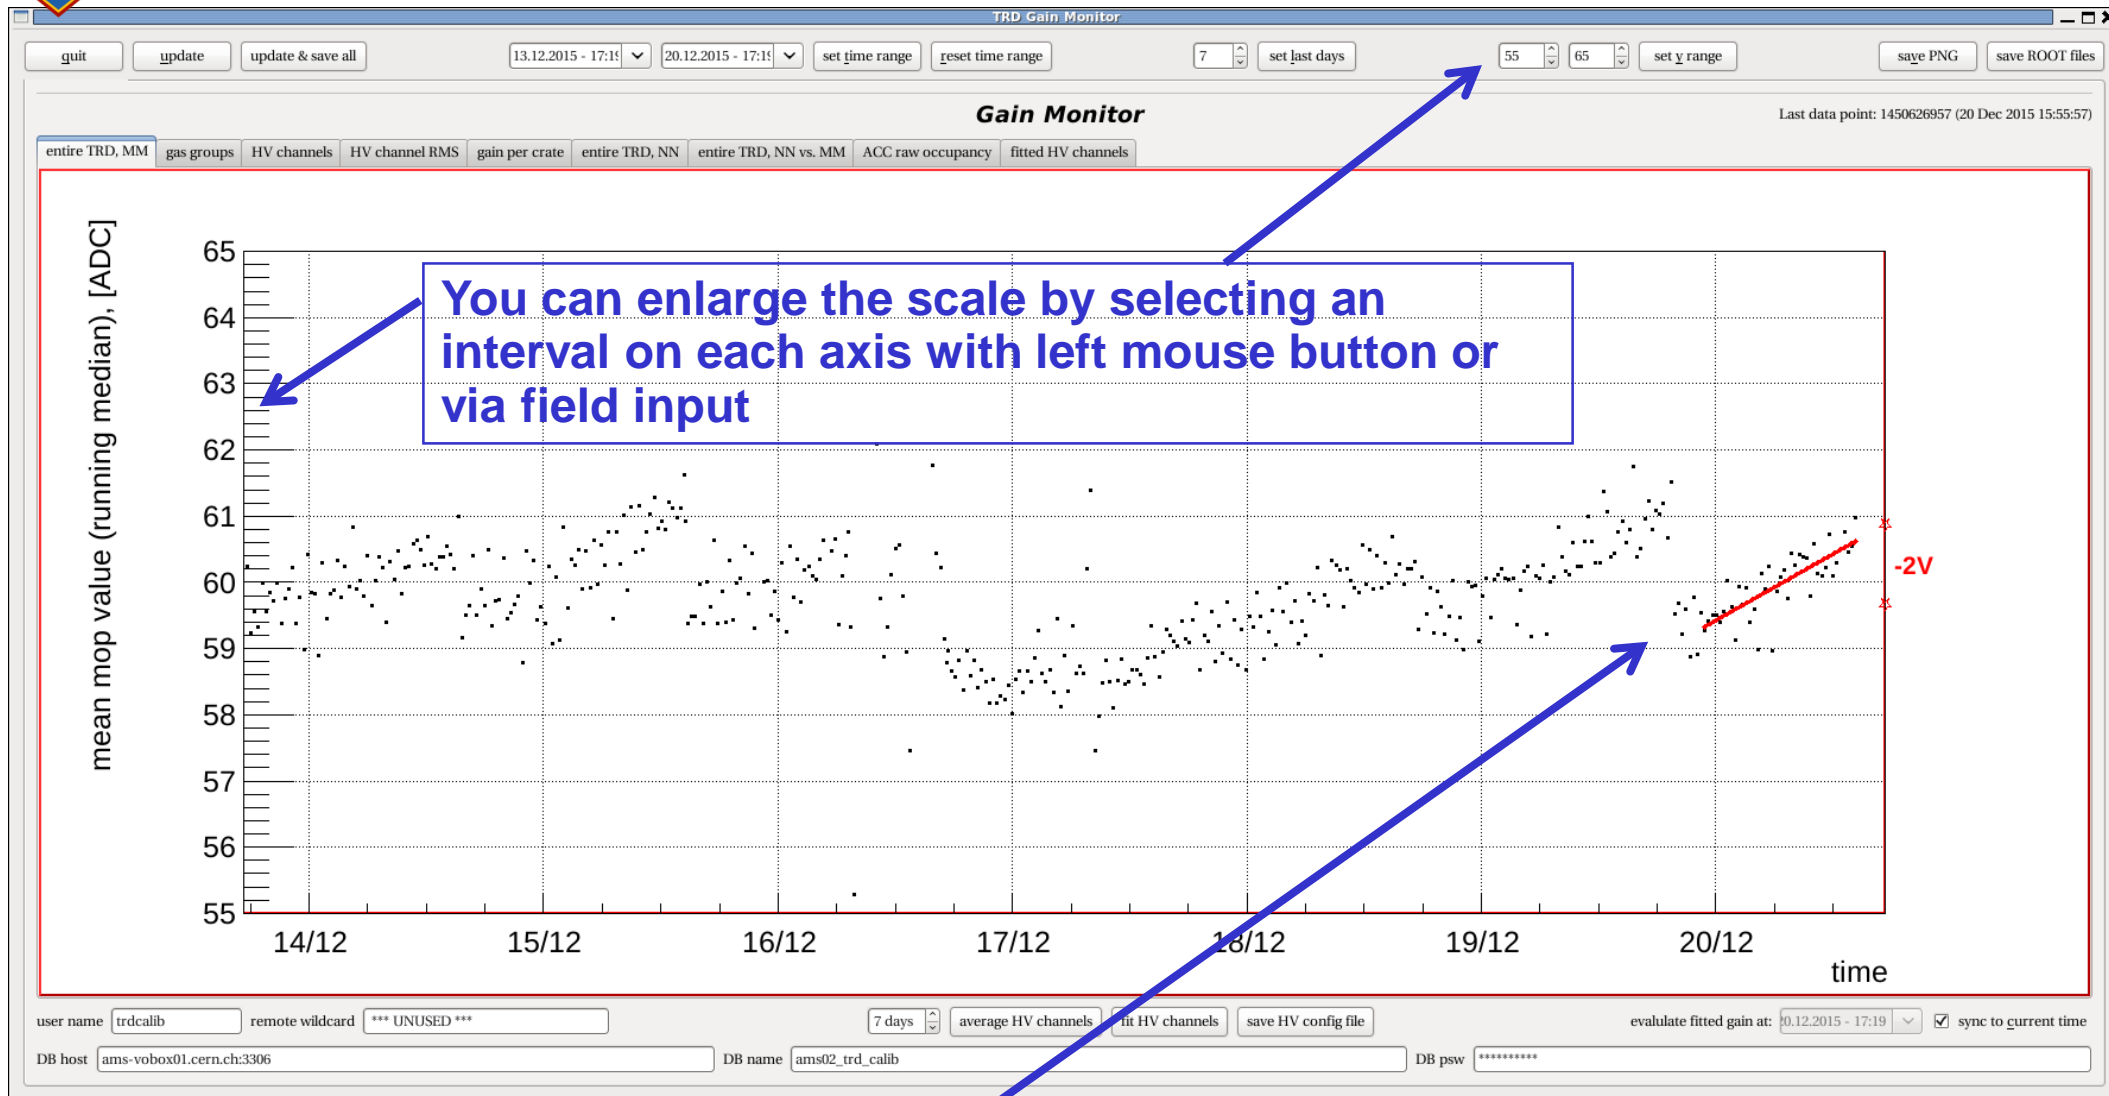

User name is trdcalib

Click on HV channels

Click on fit HV channels if you want to do daily HV intercalibration, more see procedure HV adjustment

You get the actual HV adjustment value by fitting the slope. The fit region is marked with left mouse button. The std-Versions of ROOT-Files mostly are not more then 1 hour old, therefore after the fit the estimated actual mean mop value is shown plus the mean mop value if the estimated HV-adjustment would be done.

TRD Pressure Monitor:

The absolute pressure of the TRD (P3, P4), the differential pressure measurements in the active manifolds of the TRD, the temperatures in the TRD and the gas composition and the are monitored. The leak rate of the TRD is fitted with the program .

TRD-PressureMonitor

The screenshot shows the TRDGas Status Monitor window. The title bar reads 'TRDGAS-S@pcpoc61' and 'FS 16-May-11'. The main window title is 'TRDGas Status Monitor'. The interface includes a directory field set to '/Data/BLOCKS/HKLR/CDP', a file selection field showing 'L 0 0 2 4 4 2 5', and a 'File' field with '0038' and '147'. There are 'Time' fields showing '20110527 21:31:59' and '20110611 16:41:30'. A 'READ' button is highlighted in red. Below these are status indicators for 'TRDGas Press', 'TRD Press', 'TRDGas Temp', 'TRD Temp', and 'Leak', all showing 'OK'. A 'CLEAR' button is next to the 'Leak' indicator. At the bottom is a log window with the following text:

TRD/TRDGas-Trouble Shooting 1

UG Data Collection:

UG-Crate control USCM-UG-A or -B via CANbus
 Both powered by 5V-A or -B
 UG-Board UGxx: Comm. via LeCroy-Bus
 xx=BS,BC UGxx-A powered by 5/12/29V-A
 FV,PD UGxx-B powered by 5/12/29V-B

UG POWER & INIT: JMDC in PowerStep-1

DATA	SOURCE	REQUESTED BY
----	-----	-----
UG-DTS	USCM	JMDC GTSN Loop
Octagon	Bus-1-7	
TRDGAS	Bus- 8	
USCM	Bus 9	
UG-HKP	UGBS/BC	UG-CtrlTask Loop
UG-MFdP	UGFV/USCM	UG-CtrlTask Loop
UG-HKP	UG-CtrlTask	JMDC Qlist #7A
UG-MFdP	UG-CtrlTask	JMDC Qlist #7A
UG-SPIRO	UGBC/USCM	JMDC Qlist #7B

All REQ are echoed to ground,
 So UG-HKP and -MfdP are received twice

TRD/TRDGas-Trouble Shooting 2

UG Data missing in TRDGAS-M – but AMS data is arriving

All Data Missing:

UG Supply Current [92] = 0 ?	UG-Crate OFF	Ask LEAD to power on UG-A and INIT UG-A
No response from USCM-UG-P ?		Ask LEAD to Re-Initialize UG-A Check the replies
Try other USCM-UG		Ask LEAD to set UG-P to USCM-UG-B and INIT UG-A
Try UG-Crate Power Cycle		Ask LEAD to power-cycle PDS UGPD-A feed and INIT UG-A
Try other half of UG-Crate		Ask LEAD to power PDS UGPD-B and INIT UG-B

Only DTS Data missing: Ask LEAD to check UG status in GTSN Loop (and activate)

Only Spirometer Data missing: Ask LEAD to check JMDC Qlist entry 7B (and activate)

Only Pressure and MfdP missing: Ask LEAD to check UG-CtrlTask status (and start)

With LeCroy Errors: Ask LEAD to SwitchOff UGPD DC/DC-A and INIT UG-A

UG Replies are logged by TRDGAS-M in ./UGcmdLog/

Each time TRDGAS-M is started, new logfiles are opened with UNIXTIME basename

Replies from UG-Command-Files sent from ground (TAG F7A): UNIXTIME.CmdFile

Other UG related Replies: UNIXTIME.UGreply

TAGs: 200 PowerStep-1 requests to UG-Crate, UG-CtrlTask, Qlist, GTSNloop

C7A Qlist UG-HKP/MFdp request to UG-CtrlTask

C7B Qlist UG-SPIRO request to UG-Crate

E06 UG-CtrlTask requests to UG-Crate

TRD/TRDGas-Error Messages

Expected TRDGAS-M ERROR Messages after UG-INIT in AMS Power-Step-1:

events with error

Errors would
be listed here

events in file

Check for time of data

Check active JINF-U's

- Can be used to check the Power/DAQ configuration
- Check that there are no TRD command errors
- Look out for too many events with errors in one file (>10%)

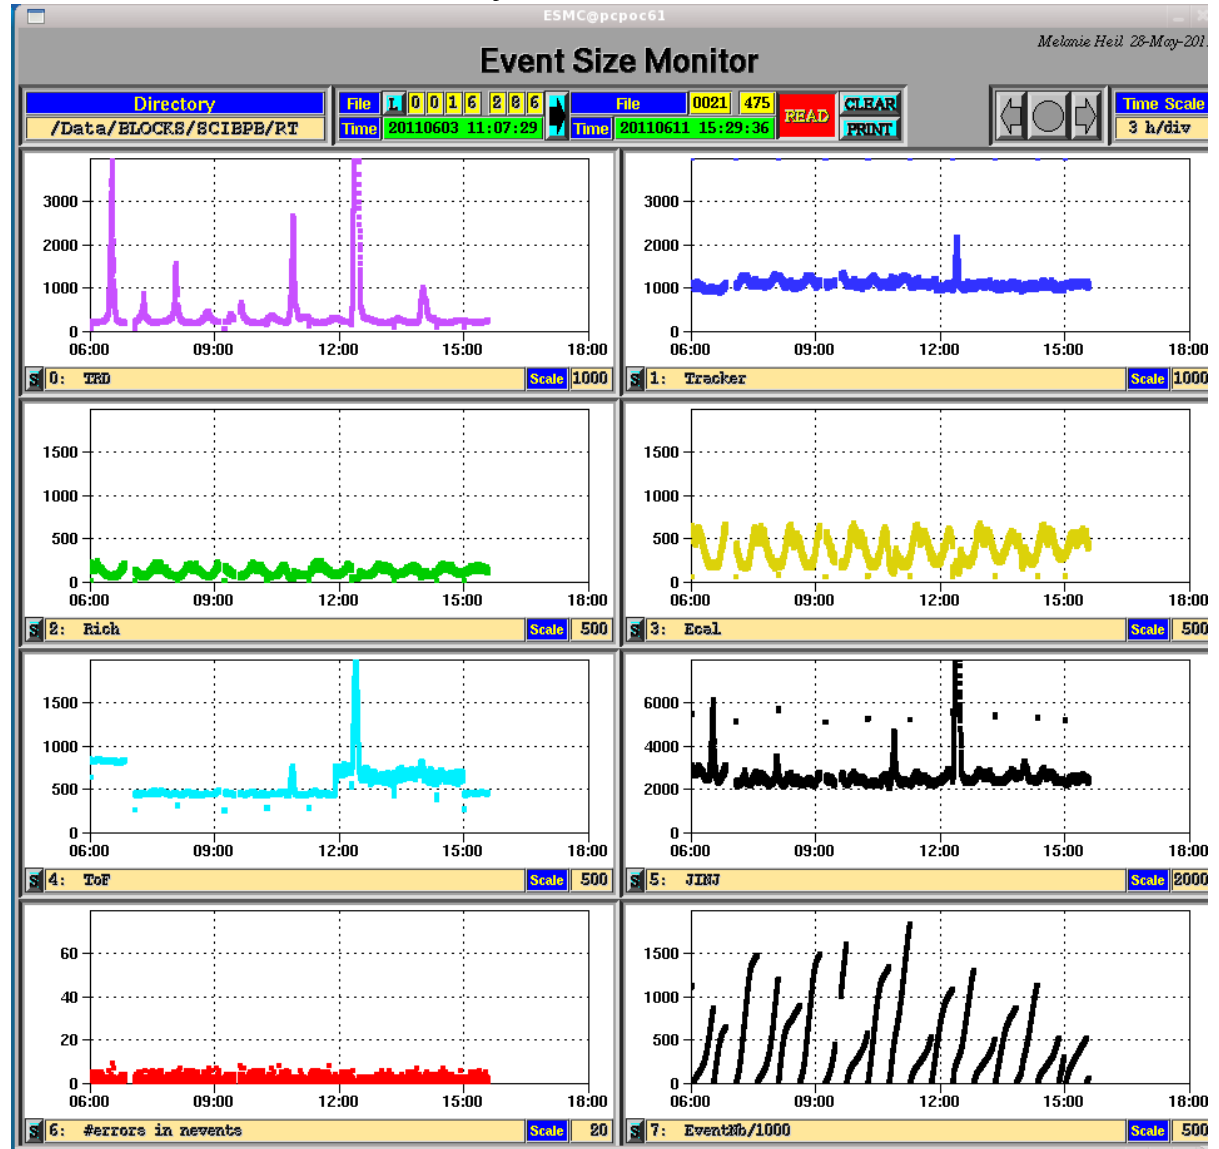

Event Size Monitor:

- Start the program from the RUN directory:

```
cd ~trd/RUN
ESMC &
```

average TRD Event Size →

check that event size is stable except for:

- TAS Runs,
- Polar region
- South Atlantic Anomaly

TRD-HV: direct commanding -> use only in case of problems!

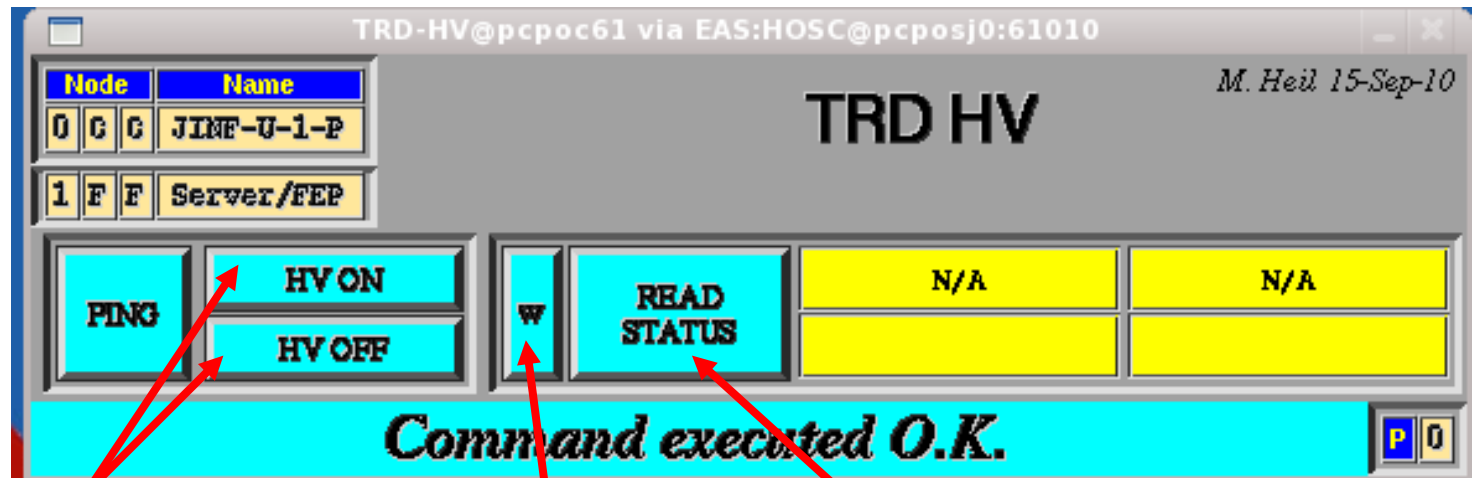

- go to RUN directory and open program:

```
cd ~trd/RUN
```

```
TRD-HV 'link' 'server' &
```

Select active
JINF-U-0-P or
JINF-U-1-P

Can be used to check
communication

Ramp up or switch off
HV on all channels
Reset of tripped HV

Write current HV
values to register

Read HV values from register

- Can be used to check the HV of the TRD

-> if HV on: Boxes should be green and value should match HV settings

-> else: Boxes should be green and read 'OFF'

- Set P=1 to get single channel HV settings (A/B) and values (A/B) from 'REQUEST STATUS' as output in terminal

TRD-Configurator:

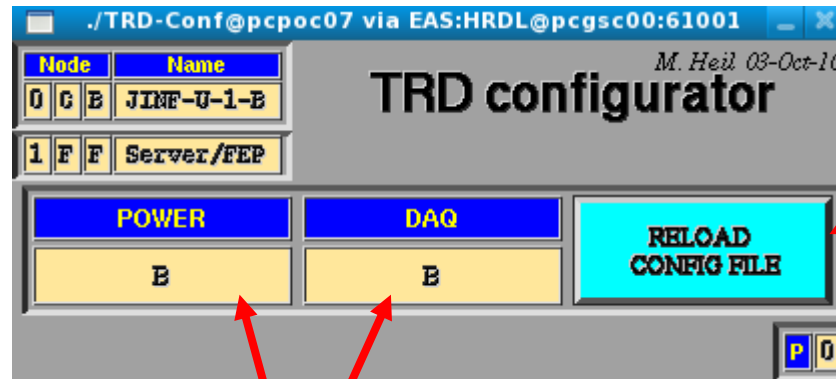

direct commanding -> use only in case of problems!

- go to the RUN directory and open the program:

```
cd ~trd/RUN
```

```
TRD-C 'link' 'server' &
```

Select only one or both JINF-U's (for only one, set the second panel to 1FF)

Reload corresponding Configuration file

Set the current POWER/DAQ configuration used

- can be used to recover from different problems

TRD Status Monitor Pro:

Go to RUN directory and open programm:

```
cd ~trd/RUN
```

```
TRD-SP &
```

- Set to directory and file of interest
- Can be used to check all settings on UPDs and UPSFEs
- Helps finding location and cause of problem in case of error

The screenshot shows the TRD Status Monitor Pro interface with the following components:

- State Interval:** never
- Directory:** /Data/ELOCES/HRDL-A
- File:** 10170585
- Time:** 20101029 17:17:45
- File:** 0170 606
- Time:** 20101029 17:38:47
- Buttons:** READ, CLEAR, PRINT
- Tables:**
 - U0 (WAKE):** Set 2222, Delay 34
 - U1 (RAM):** Set 2222, Delay 34
 - UPSFE0-6:** Tables for U0 and U1 showing status for JDR, HV, FE, and UPSFE components.
 - UPD0-6:** Tables for U0 and U1 showing status for 3.3V, FE, FE1, FE2, HV, and HV2 components.

TRD HV Changing For TRD Shifter

TRD HV Changing For TRD Shifter

TRD-HV-Adjustments

To keep the TRD single straw tubes response (Most Probable Value of Landau-Distribution of dE/dx) for a Minimum Ionizing Particle (MIP) at a stable value of 60 ADC-channels and to keep the spread of the individual HV channels gain very low, the HV inter calibration should be adjusted on a daily basis: There exists two procedures, the standard one does the HV intercalibration, the other one adjusts the HV channels with an overall value

- HV-step: $\Delta U = xxx \text{ V}$ (has/have to be determined via GainMonitor!!)
- Adjustment should be done, when AMS is close to an end of run to take new calibration (to avoid short runs)
- Coordinate with AMS LEAD the best timing with respect to LOS, calibration, SAA, etc. well before you plan the action

TRD HV Changing For TRD Shifter

1.: Daily Standard Procedure:

HV Intercalibration to determine new daily HV config-file, followed by adjustment preparation (writing and uploading of config-file to JINF which should be done 10-20 minutes before adjustment) and finally the adjustment

Production of new config-file for daily HV-intercalibration and adjustment:

(1) In TRD-GainMonitor, click “Update”

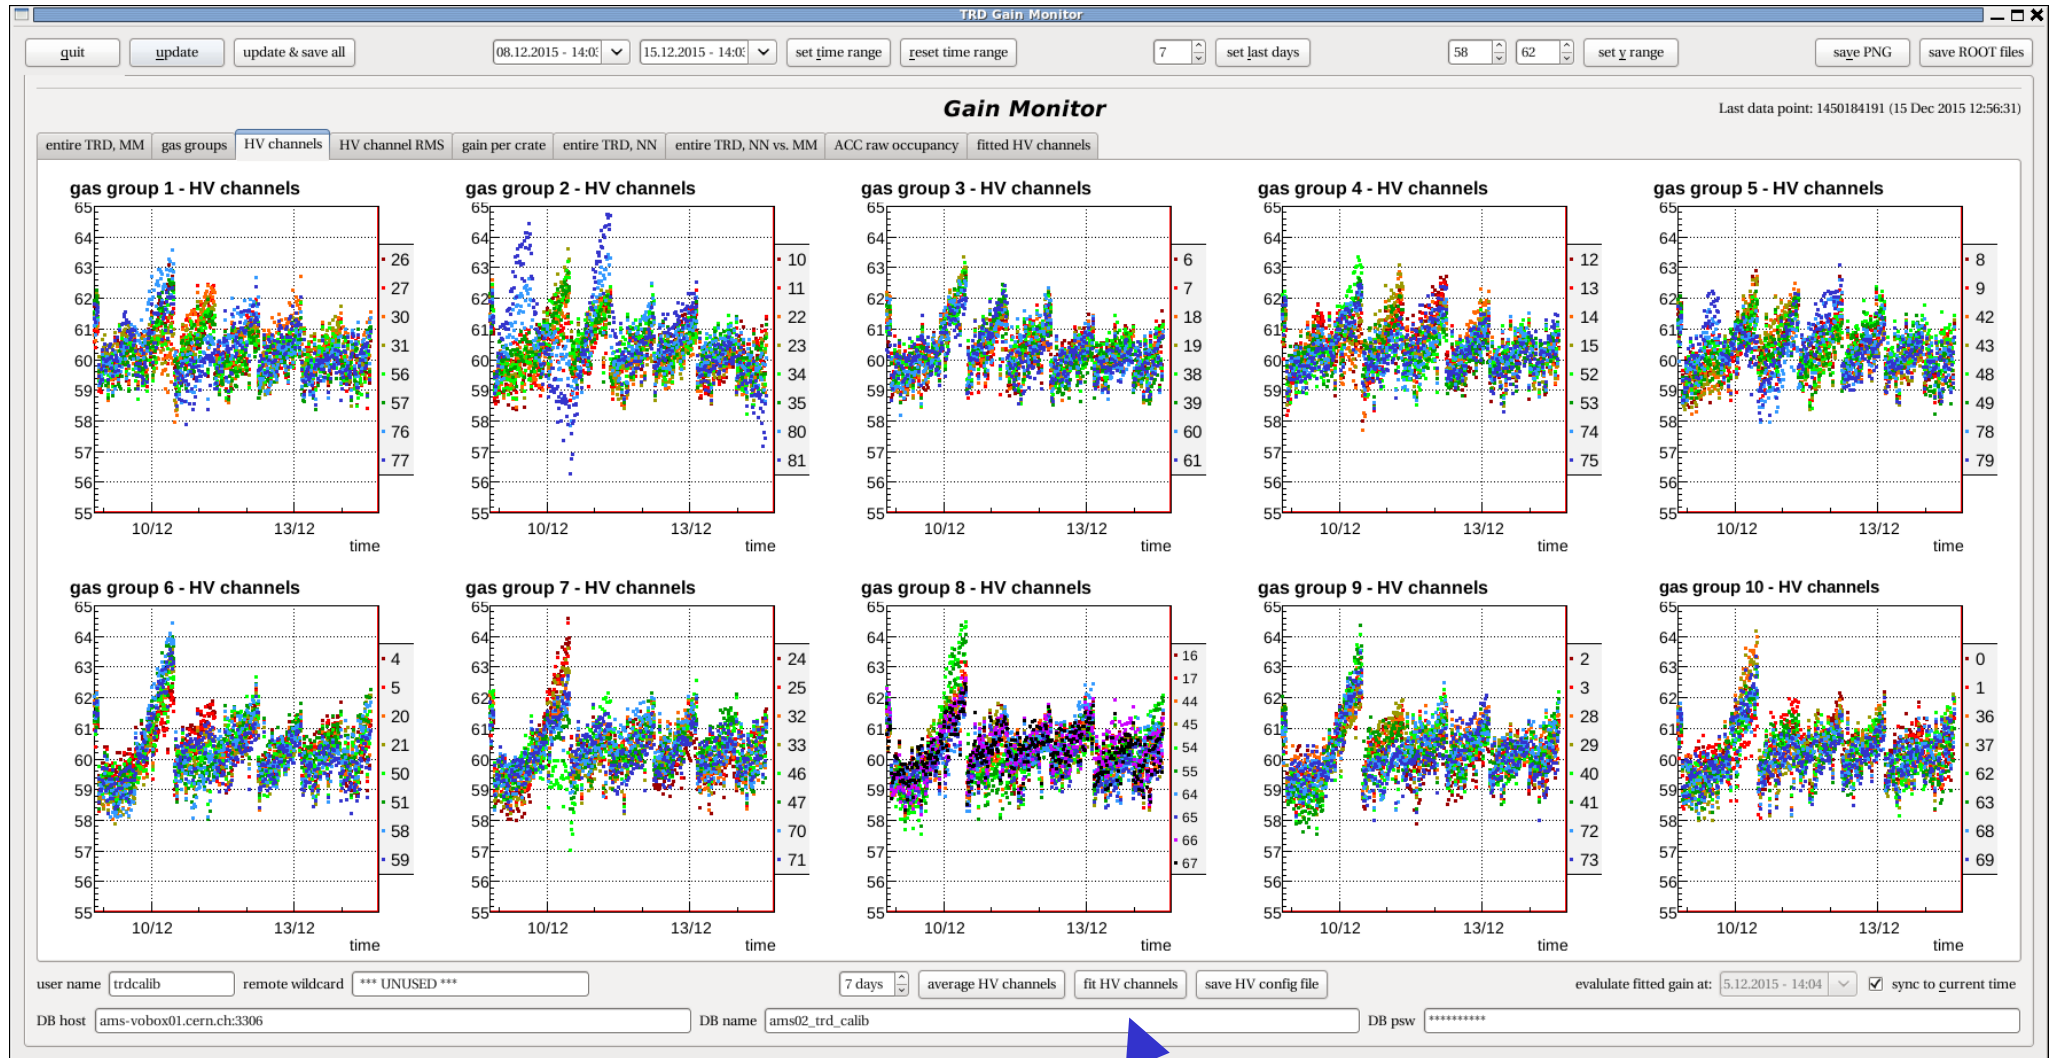

1.) TRD-HV Intercalibration and Adjustment

Production of new config-file for daily HV-intercalibration and adjustment:

(2) Select tab “HV channels”

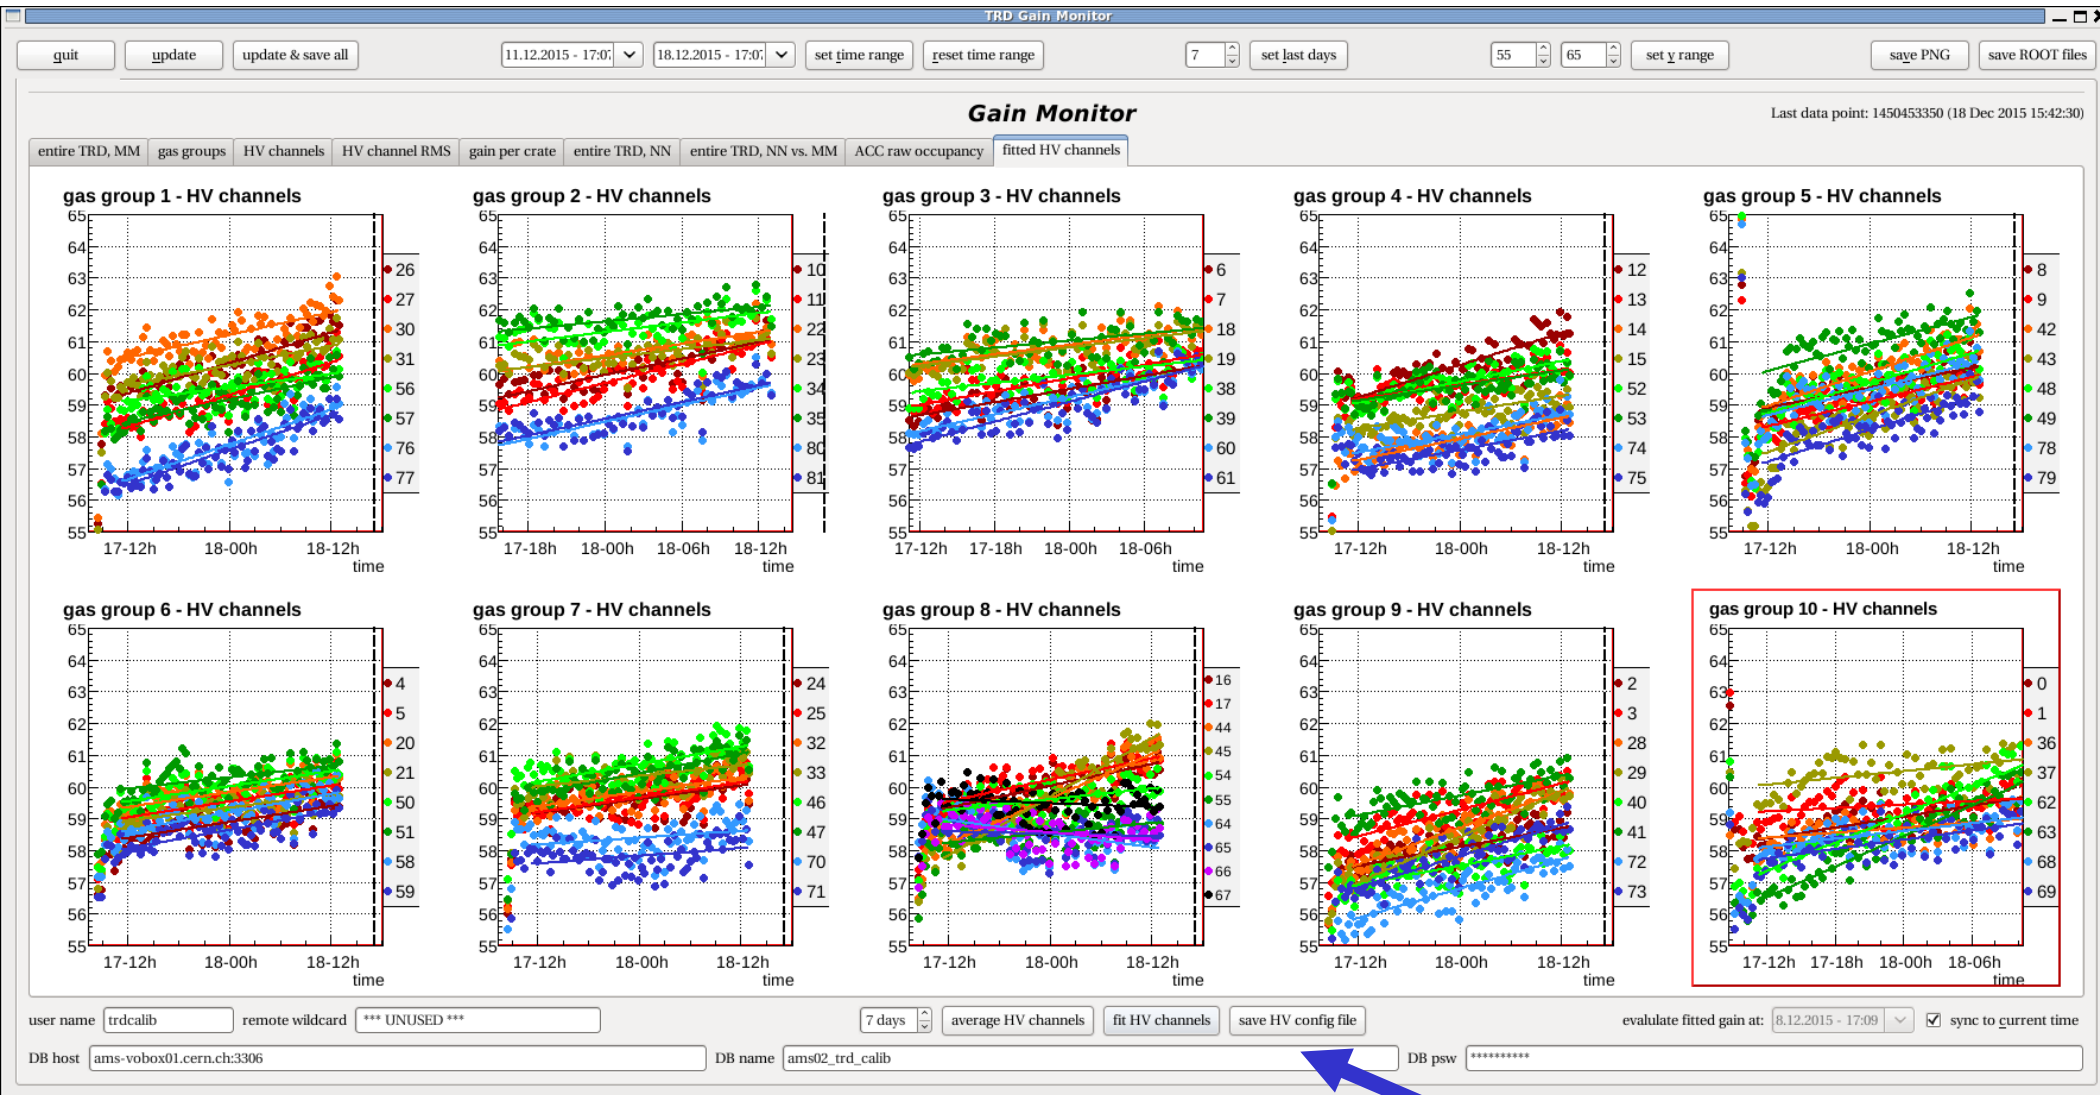

Production of new config-file for daily HV-intercalibration and adjustment:

(3) Click "fit HV channels"

Production of new config-file for daily HV-intercalibration and adjustment:

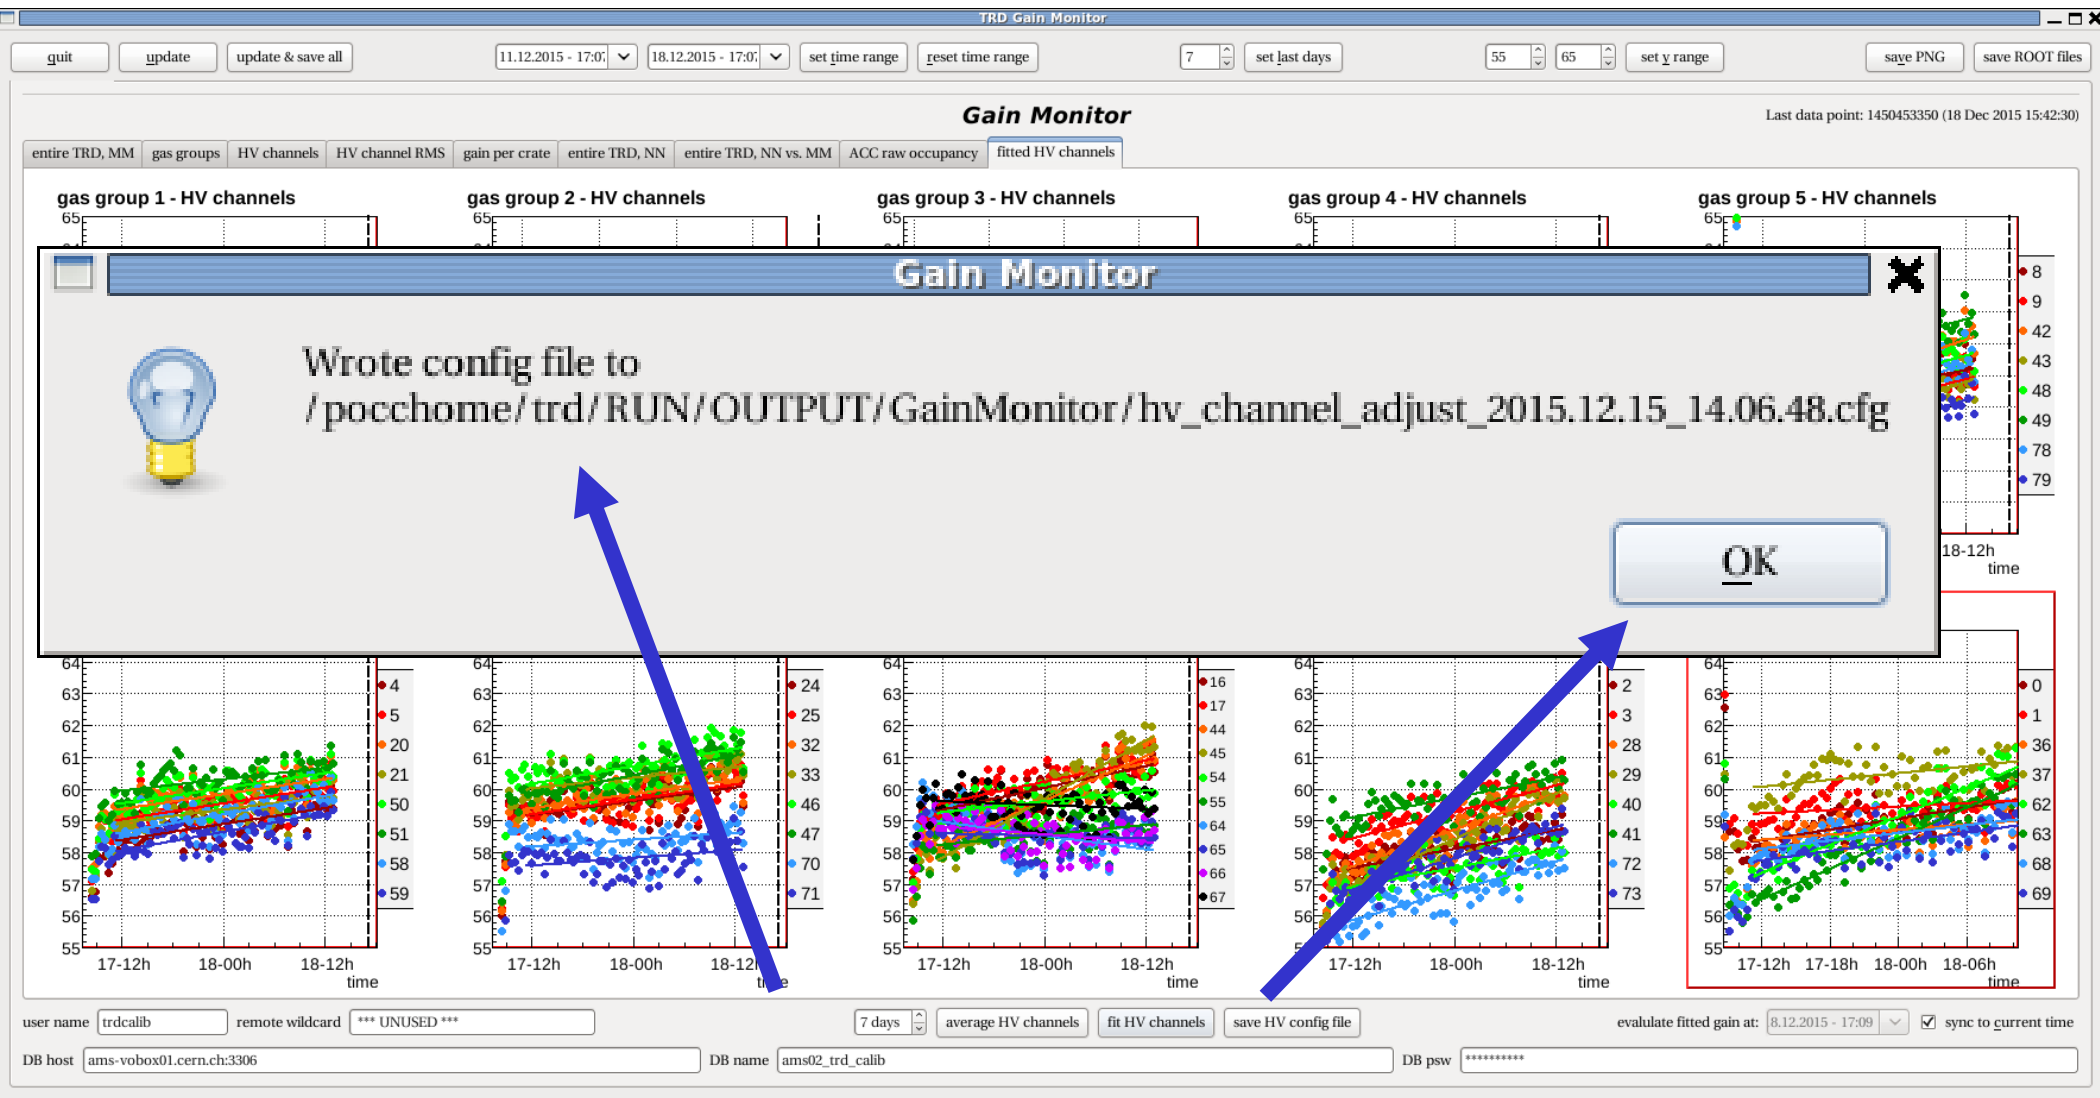

(4) Check that fits are reasonable, if not, do manual refits

(5) Fits ok, then click "save HV config file"

1.) TRD-HV Intercalibration and Adjustment

Production of new config-file for daily HV-intercalibration and adjustment:

(6) Copy config-file name with mouse and click “OK” button

1.) TRD-HV Intercalibration and Adjustment

Preparation of HV adjustment:

```
trd@pcpoc25 RUN$ prepare-trd-hv --conf filename.conf
```

```

trd@pcpoc25 RUN$ prepare-trd-hv --conf /pocchome/trd/RUN/OUTPUT/GainMonitor/hv_channel_adjust_2015.12.18_17.10.09.cfg
Command path from file "command_path.conf":
  HOSC Server = feplr
  Port        = 61010
  APID        = 981(0x3D5)
  New Peter's eassserver will be used
  Timeout     = 90.0 sec

Usage:
prepare-trd-hv [VOLTAGE / --conf config_file.conf] [--only-U0 / --only-U1] [--read-from-disk]
  VOLTAGE: <delta (e.g. -3.0)> OR <absolute values (e.g. 1400.0)> are accepted as input parameters
  --conf settings file.conf: settings file to set voltages for specific HV channels
  --only-U0 / --only-U1: use to command to one crate only (default: command to both crates)
  --read-from-disk: Read the JINF flash configuration file "7aa1" from disk.

Read-back of U0 HV returned: correct values!
Reading U1 UHVG DAC values... successful!
Read-back of U1 HV returned: correct values!
Generate sql file: /pocchome/trd/RUN/OUTPUT/sql/1450189964_apply_trd_hv.sql ... done

Adjustment of HV finished! Please notify LEAD that TRD commanding is done and that DAQ can be restarted.
[trd@pcpoc25 RUN]$
```

**(8) Apply HV adjustment,
ask LEAD for commanding,
LEAD must stop run
Inform LEAD when adjustment is
done**

Summary of Production of new config-file for daily HV-intercalibration and adjustment:

In TRD-GainMonitor:

- (1) Click "Update"
- (2) Select tab "HV channels"
- (3) Click "fit HV channels"
- (4) Check that fits are reasonable, if not, do manual refits
- (5)) Fits ok, then click "save HV config file"
- (6) Copy config-file name with mouse and click "OK" button → produces file saved in
/pocchome/trd/RUN/OUTPUT/GainMonitor/

In Xterminal:

- (7) Copy file-name into terminal command line

```
(trd@pcpoc25 RUN$ prepare-trd-hv --conf filename.conf)
```

Example: `prepare-trd-hv --conf`

```
/pocchome/trd/RUN/OUTPUT/GainMonitor/hv_channel_adjust_2015.12.15_14.0  
6.48.cfg
```

- (8) Adjust HV: in RUN Directory: `trd@pcpoc25 RUN$ apply-trd-hv`

2. Procedure:

HV adjustment done with an overall value for all HV channels.

This method is only needed during Gas Refills or in case an intercalibration of individual HV channels is not possible

This is also a splitted procedure:

a) Preparation of adjustment to determine overall value for all HV channels (10-20 min before adjustment)

b) Apply adjustment at equator

2.) TRD-HV overall Adjustment

Determine HV-value for adjustment

(1) In TRD-GainMonitor, click “Update”

Determine HV-value for adjustment

- (2) In TRD-GainMonitor, in diagram select the range for the fit using the mouse
- (3) Check Fit result

TRD HV Changing For TRD Shifter

Open Xterminal

```
trd@pcpoc25 ~$ cd ~trd/RUN
```

```
trd@pcpoc25 RUN$ set-command-path eas:hosc feplr
```

ASK LEAD for Commanding,

```
trd@pcpoc25 RUN$ prepare-trd-hv -3
```

Never type absolute values like 1400 V !!!

See example for 3V adjustment next slides !!!

At equator tell LEAD to stop DAQ, ask LEAD for Commanding and apply HV-adjustment

```
trd@pcpoc25 RUN$ apply-trd-hv
```

If the scripts fail they will print options how to proceed

If the options are not clear, call the expert!

Only use instructions on page 129 + , if you can't get a hold of the expert!

HV change

Go to line 117

Type new HV Value

(default HV 1480 V @ 1000mbar)

TRD HV Changing For Experts Only

- after changing config-files transfer of config-files to JINFs:

Tell LEAD to stop DAQ!

ASK LEAD for Commanding,

```
trd@pcpoc25 TRDDAQ$ set-command-path eas:hosc feplr
```

```
trd@pcpoc25 TRDDAQ$ create-config U0_FM_AA.conf c8 REPLACELOAD
```

(c8 = JINF-U-0-P)

If Replace successful:

Write JINF config file successful!

Load JINF config file successful!

Do the same with U1_FM_AA.conf:

```
trd@pcpoc25 TRDDAQ$ create-config U1_FM_AA.conf cc REPLACELOAD
```

(cc = JINF-U-1-P)

Once you have done this, you ALSO need to set the individual channel voltages accordingly (see previous section). Use `adjust-trd-hv - conf`

```
~/trdsoft/trd_acc_tas/TRD/adjust_trd_hv_conf_files/hv_channel_adjust  
_combined.conf --only-U1 (or --onlyU0)
```

- DAQ should already be stopped. Go to TRD-HV on screen 4!
 - Click Button 'HV ON'
 - Click Button 'Read Status' – the status should change to **the current value**

Go back to Step 5 on page 141

- **Tell LEAD to start DAQ again and that TRD Commanding is done!**

TRD-HV@pcpoc61 via EAS:HOSC@pcposj0:61010

TRD Emergency Actions For Temperature Control:

- 1) Heaters On/Off**
- 2) Pump On/Off**

1.a) TRD Xenon Vessel Heater Switch on

TRD Xenon Vessel Heater Switch on

Qualifying Conditions:

if Box C temperature drops below 8/9 degrees and will not be warming up soon (ask Joe Burger if you do not know what the maneuver plans are) we consider turning on Xenon vessel heaters.

- **Confirm all actions with the trd-expert list first.**
 - **Call Klaus Lübelmeyer**
 - **Email Stefan Schael, Thomas Kirn, Thorsten Siedenburg, Bastian Beischer, Stefan Zeissler and Valery Zhukov.**
- **Once the procedure is agreed, follow next steps ...**
- **If you're doing a gas refill in the next few days, REMEMBER that the Xenon Vessel should not be more than 5° C warmer than the Mixing Vessel. To avoid this, turn off the heaters at LEAST 36 hours before the refill should start.**

TRD Xenon Vessel Heater Switch on

- Be sure that there is item 14 in the TQ list – ask LEAD. It should currently be disabled. (If this item does not exist and you or the TRD expert do not know how to fix this, Mike Capell knows how to fix it.)
- Confirm with LEAD that you have ability to send commands.
- Then, open a new TRD terminal and type:
trd@pcpoc25 trd \$ `cd ~/RUN/COMMANDING/TRDGAS`
trd@pcpoc25 TRDGAS \$ `set-command-path eas:hosc feplr`
trd@pcpoc25 TRDGAS \$ `./Heat_Xenon.csh A`
- Watch for 8 replies

Check for these changes in the TRD-Gas Monitor plots (see next slide)

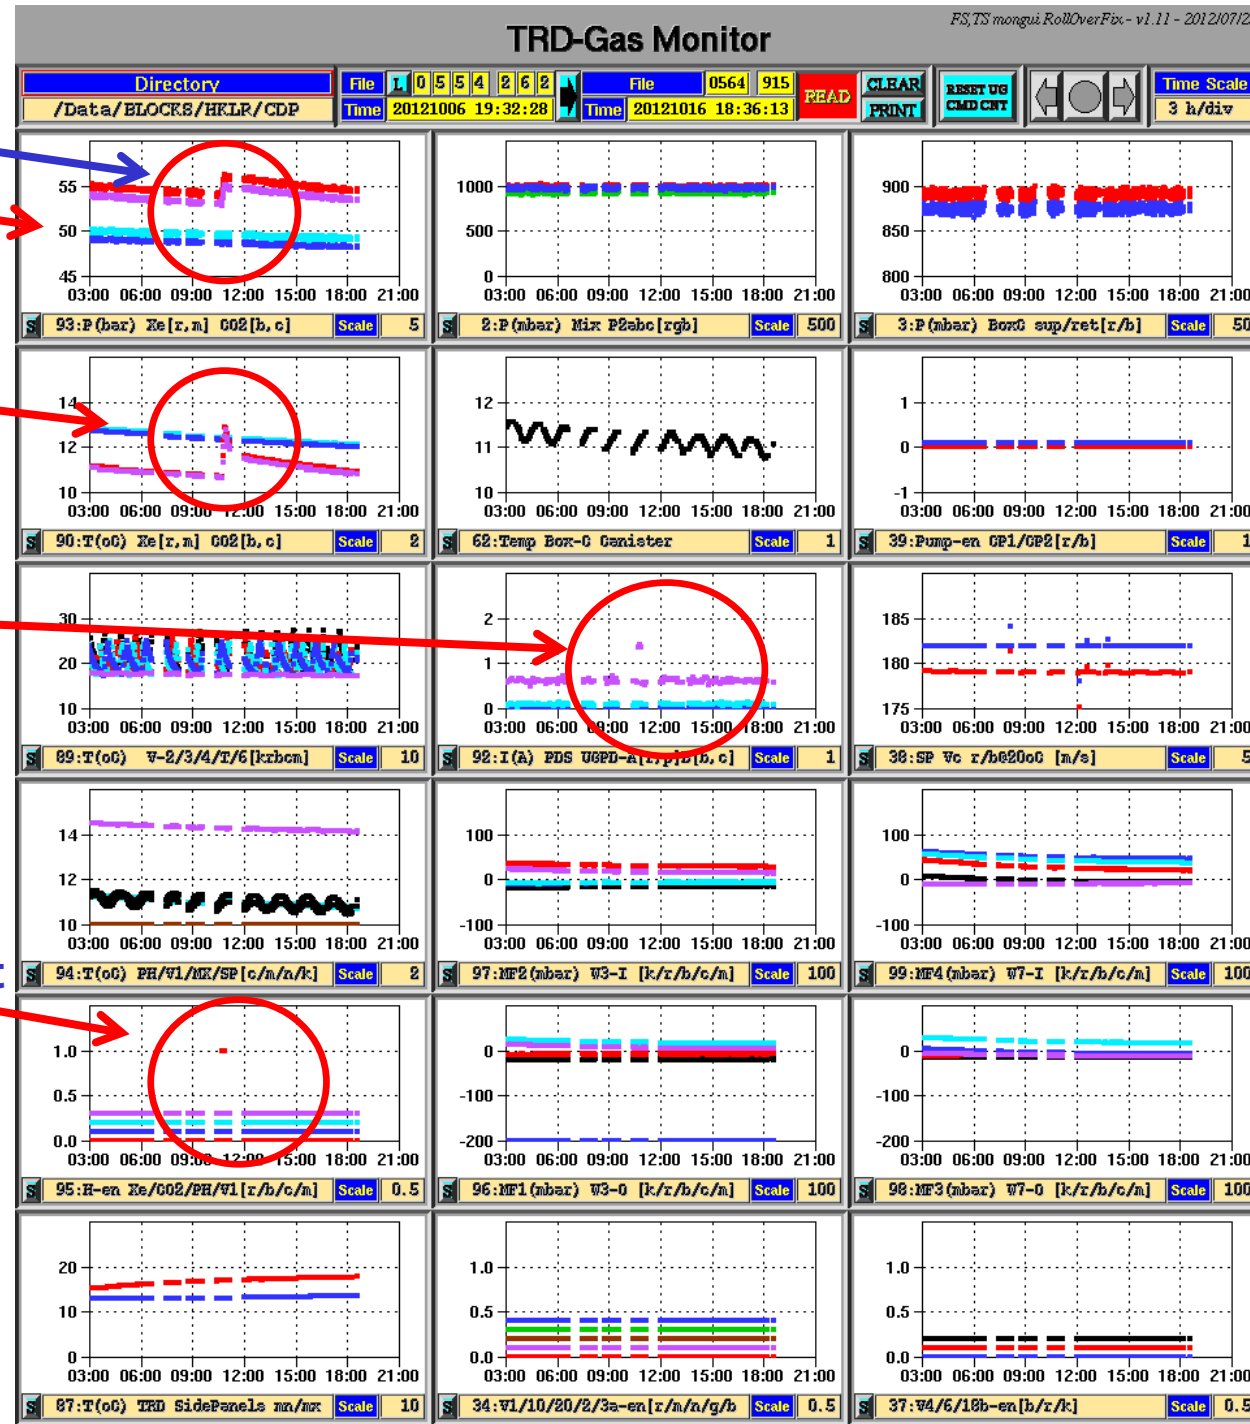

- Current should go from 0.6A to 1.4A (plot 92, center)
- Xenon heater enable Bit changes from 0 to 1 (plot 95, lower left)
- Xenon Temperature and Pressure (top left, plots 90 and 93) should increase
- CO2 pressure and temperature (same plots) should be unaffected

It takes ~8 hours to heat up from 8 degrees. There is a thermostat, which will keep the heater running between: **Xe: ON 38°, OFF 49°, CO2: ON 43°, OFF 54°**

The Box C temperature will increase by about 1 degree from where it would have been otherwise.

TRD Xenon Vessel Heater Switch on

Xe-Vessel Pressure raises, CO2 not

Xe-Vessel Temperature raises, CO2 not effected

UG current from 0.6 A to 1.4 A

Xenon-Heater enable bit From 0 to 1

1. b) TRD Xenon Vessel Heater Switch off

TRD Xenon Vessel Heater Switch off

Do once you have confirmed that the temperature range is out of danger – Box-C temperature should be at 10 or 11 degrees.

- Confirm with LEAD that you have ability to send commands.
- Open a new TRD terminal and type:

```
trd@pcpoc25 trd $ cd ~/RUN/COMMANDING/TRDGAS
```

```
trd@pcpoc25 TRDGAS $ set-command-path eas:hosc feplr
```

```
trd@pcpoc25 TRDGAS $ ./Disable_Heaters.csh A
```

- Watch for 3 replies
- Have LEAD check that TQ list item 14 is now disabled again.

Check for these changes in the TRD-Gas Monitor plots
(see slides before)

- Current should go from 1.4A to 0.6A (plot 92, center)
- Xenon heater enable Bit changes from 1 to 0 (plot 95, lower left)
- Xenon Temperature and Pressure (top left, plots 90 and 93) should decrease
- CO2 pressure and temperature (same plots) should be unaffected

Box-C temperature should decrease by about 1 degree from where it would have been otherwise.

TRD Xenon Vessel Heater Switch on/off

An example of temperature and pressure plots during Xenon vessel heating

Xenon Temp / deg C

Xenon Pressure/ bar

Spirometer Temp/bar

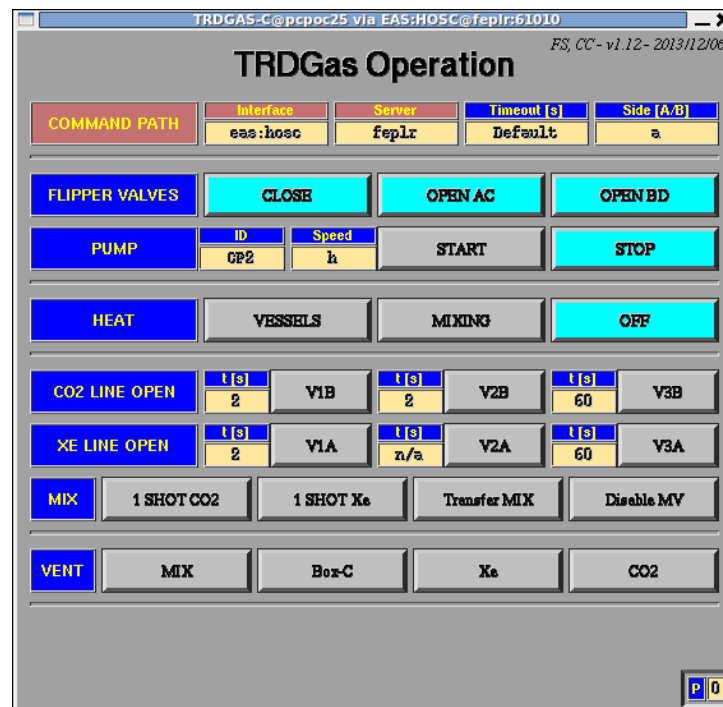

TRD Xenon Vessel Heater Switch on/off using GUI

An alternative method is to use the GUI. However the gui can only talk to both vessel heaters (Xenon & CO₂) at once. This is okay for simply turning the heater off. But for turning on be sure to get approval to turn **BOTH** heaters on.

Note: Turning the vessel heaters ON in this way requires CONSTANT Monitoring to keep the temperature in the correct range: 20-40°C. The automated script is MUCH simpler. Only follow this procedure if ABSOLUTELY NECESSARY !!!

- Inform LEAD that you will be turning on the heaters.
- Ask LEAD if you have ability to send commands.

TRD Xenon Vessel Heater Switch on/off using GUI

To open the GUI, you must open three terminals

1st terminal (start the TRDGAS-Operation-Gui):

```
trd@pcpoc25 ~$ cd ~trd/RUN/
```

```
trd@pcpoc25 RUN$ set-command-path eas:hosc feplr
```

```
trd@pcpoc25 RUN$ TRDGAS-C eas:hosc feplr
```

2nd terminal (start TRDGAS-M):

```
trd@pcpoc25 ~$ cd ~/RUN/
```

```
trd@pcpoc25 RUN$ set-command-path eas:hosc feplr
```

```
trd@pcpoc25 RUN$ TRDGAS-M C
```

3rd terminal:

Look in 2nd terminal, where you opened TRDGAS-M C. There is a file called CmdFile which it says it will write to. For each command sent from the gui, confirm that there are no errors here (ERR, ABORT, etc...). Also watch for proper number of replies for each command.

Watch this file:

```
trd@pcpoc25 RUN$ tail -f /path-to-file/CmdFile_....dat
```

TRD Xenon Vessel Heater Switch on/off using GUI

When looking at GUI,

check that

- interface is **eas:hosc**
- server is **feplr**
- Side [A/B] is **a**

The screenshot shows the TRDGas Operation GUI. The title bar reads "TRDGAS-C@pcpoc25 via EAS:HOSC@feplr:61010". The main title is "TRDGas Operation" with a version string "FS, CC - v1.12 - 2013/12/06".

COMMAND PATH	Interface	Server	Timeout [s]	Side [A/B]
	eas:hosc	feplr	Default	a

Below the configuration table are several control buttons:

- FLIPPER VALVES: CLOSE, OPEN AC, OPEN BD
- PUMP: ID (GP2), Speed (h), START, STOP
- HEAT: VESSELS, MIXING, OFF
- CO2 LINE OPEN: t[s] (2), V1B, t[s] (2), V2B, t[s] (60), V3B
- XE LINE OPEN: t[s] (2), V1A, t[s] (n/a), V2A, t[s] (60), V3A
- MIX: 1 SHOT CO2, 1 SHOT Xe, Transfer MIX, Disable MV
- VENT: MIX, Box-C, Xe, CO2

Red arrows point from the text in the left box to the "Interface", "Server", and "Side [A/B]" fields in the configuration table.

TRD Xenon Vessel Heater Switch on/off using GUI

To turn the Heaters ON:

- Click [HEAT] [Vessels]
- Watch for 9 replies in 3rd terminal
- Watch for the changes in the plots as before

To turn the Heaters OFF:

- Click [HEAT] [OFF]
- Watch for replies in 3rd terminal
- Watch for the changes in the plots as before

TRDGAS-C@pcpoc25 via EAS:HOSC@feplr:61010 FS, CC - v1.12 - 2013/12/06

2.) Pump ON/OFF

Qualifying Conditions:

*if Box C temperature drops below 7 degrees and will not be warming up soon (ask Joe Burger if you do not know what the maneuver plans are) AND the Xenon vessel heater is already on, we consider turning on the pump – it should get you ~2 degrees for the BOX-C temperature. **THIS PROCEDURE IS A LAST RESORT !!!***

- **Confirm all actions with the trd-expert list first.**
 - Call Klaus Lübelmeyer
 - Email Stefan Schael, Thomas Kirn, Thorsten Siedenburg, Bastian Beischer, Stefan Zeissler and Valery Zhukov.
- **Since this will affect the science data we take, this must be confirmed also with Prof. Ting**
- Once the procedure is agreed, follow next steps ...

TRD Xenon Vessel Heater Switch on/off using GUI

- Inform LEAD that the pump will be turned on
- Tell LEAD to increment the runtag
- Ask if you have ability to send commands to AMS

To open the GUI, you must open three terminals

1st terminal (start the TRDGAS-Operation-Gui):

```
trd@pcpoc25 ~$ cd ~/RUN/  
trd@pcpoc25 RUN$ set-command-path eas:hosc feplr  
trd@pcpoc25 RUN$ TRDGAS-C eas:hosc feplr
```

2nd terminal (start TRDGAS-M):

```
trd@pcpoc25 ~$ cd ~/RUN/  
trd@pcpoc25 RUN$ set-command-path eas:hosc feplr  
trd@pcpoc25 RUN$ TRDGAS-M C
```

3rd terminal:

Look in 2nd terminal, where you opened TRDGAS-M C. There is a file called CmdFile which it says it will write to. For each command sent from Gui, confirm that there are no errors here (ERR, ABORT, etc...). Also watch for proper number of replies for each command.

Watch this file: `trd@pcpoc25 RUN$ tail -f /path-to-file/CmdFile_....dat`

Pump ON/OFF using GUI

When looking at GUI,

check that

- interface is **eas:hosc**
- server is **feplr**
- Side [A/B] is **a**

Pump ON/OFF

Reset Command Counters after each set of replies

This is example of the pump turning off. When turning on it does the opposite.

**TRD HV OFF/ON for an AMS-02
Power Down or Power OFF
(and then presumably
Power Up/On)**

Power Down/Off or Up/On TRD HV On/Off

When does this happen?

- In this case, it was a Soyuz docking on 7th Nov 2013, while AMS on ISS was at an extremely negative beta angle. There was not enough power to both dock the Soyuz **AND** to keep the AMS DAQ running. Many systems were powered **down** for this maneuver.

Stage 1: Prior to Docking turn TRD HV Off

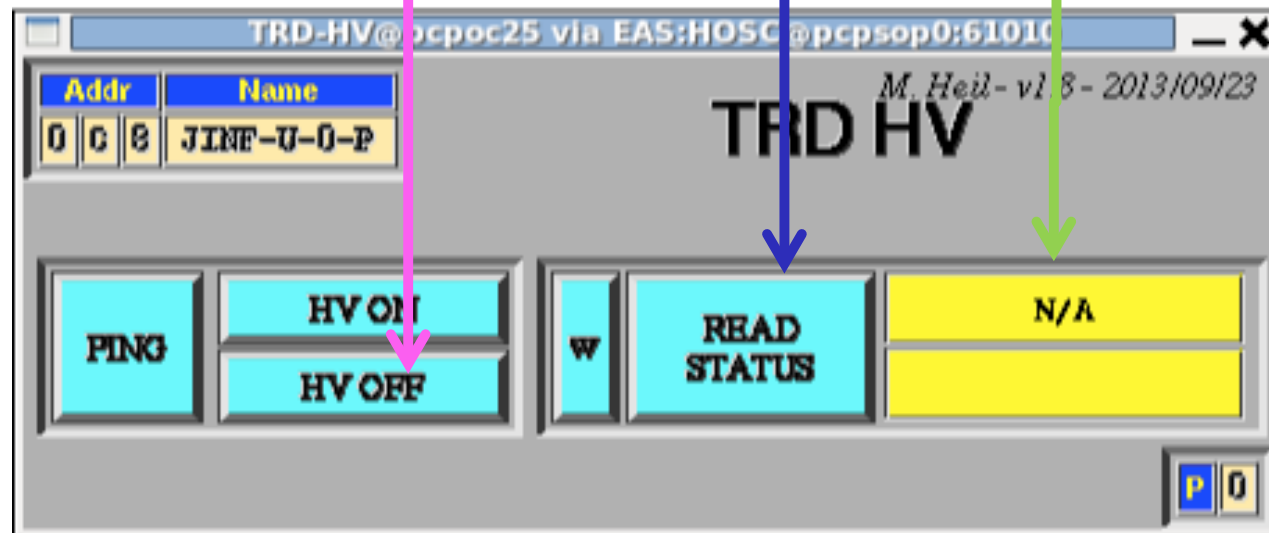

After LEAD has stopped DAQ and **before** crates are powered off:

- In elog, note current HV settings for U0 and U1 from TRD-S
- Open new terminal and type:

```
cmds_mon -g -m HOSC
```
- From another new terminal open TRD-HV gui:

```
cd ~/RUN
Set-command-path eas:hosc feplr
TRD-HV eas:hosc feplr
```
- For both JINFs ((U-0-P and U-1-P) *in turn*:
 - Switch Gui to proper JINF (**Node C8 for U-0-P and CC for U-1-P**) using right and left clicks
 - Left Click **"READ STATUS"**
 - Left Click **"HV OFF"**
 - Left Click **"READ STATUS"**
 - Repeat "READ STATUS" until yellow box **turns green and reads OFF**
- Communicate to LEAD that TRD HV is off and they can proceed to power off the UPDs

Watch this terminal for any aborts for commands sent to JINF-Us

Stage 1: TRD HV Off

After "READ STATUS"

After TRD HV ON

After TRD-HV status reports the voltage one should check the statuses of the individual JINFs and UDRs (must be a better way to do this?)

Type the following and look for “Err 0000” at the end of the reply:

```
cd ~/RUN  
  
set-command-path eas:hosc feplr  
  
my-t R JINF-U0-P 14 2002  
my-t R JINF-U1-P 14 2002
```

And cycle through all of:

```
my-t R UDR-[0-1]-[0-5]P 14 2002  
(ie, my-t R UDR-0-0P 14 2002  
...  
my-t R UDR-1-5P 14 2002 )
```

HV and DAQ back ON

Power Back up: Trouble Shooting

The first sign will likely be the following “Not OK” when you power back up (Step 2b):

The screenshot shows the TRD HV control interface. At the top right, it displays 'M. Heil - v1.8 - 2013/09/23'. The main title is 'TRD HV'. In the top left, there is a table with columns 'Addr' and 'Name':

Addr	Name
0 0 0	JINF-U-1-P

Below the table are several buttons: 'PING', 'HV ON', 'HV OFF', 'W', and 'READ STATUS'. To the right of these buttons is a red box containing the text 'Not OK' and a yellow box containing the timestamp '20131107 04:21:09'. At the bottom, a large cyan box displays the message 'Command executed O.K. Tag=06BD' and a small 'P 0' indicator.

This can happen if something went wrong in Step 2a! What follows are a few solutions to try...

Power Back up: Trouble Shooting

Solution 1: Execute the command file called by the PowerUp.csh script by hand...

1) Type:

```
cd ~/RUN/COMMANDING/TRDGAS/CommandFiles/PowerUp
set-command-path eas:hosc feplr
```

2) Now, send a status command to each JINF, like so:

```
my-t R JINF-U0-P 14 2002
my-t R JINF-U1-P 14 2002
```

If the replies looked something like this you have a **problem**:

```
exec::RQ R NA=C8 DT=14 DC=2: 20 02
REQUEST: [0] RQ R NA=0C8 DT=000014 DC=2 D = 2002
REPLY:   [0] RP R NA=0C6 DT=000014 DC=0 Tag=0259 Err=000D
```

(Error is 000D)

Power Back up: Trouble Shooting

Solution 1 con't²:

3) If Steps 1 and 2 work, *copy and paste* each line from TRD_INIT.com that IS NOT COMMENTED OUT and prepend it with my-t, like so:

```
emacs TRD_INIT.com &
```

```
my-t W JINF-U0-P 6 7AA1
```

```
my-t W JMDC-SELF 1F0207 0000 05DC
```

```
etc...
```

Power Back up: Trouble Shooting

Solution 2: Use the JINF Controller

(If you've trained for LEAD you may remember how to use this; if not here's a quick tutorial.)

Type:

```
cd ~/RUN
```

```
set-command-path eas:hosc feplr
```

```
JINF eas:hosc feplr
```

This will pop up the following display:

Weird HV “blink” on Nov 18 2014

```

What happened?

The status monitor checks its values against the config file.

In this case—completely random chance, and will almost never happen—the status monitor updated its data just exactly as the HV changed, but BEFORE the new config file was written.

This means that it sees the new values, which ARE correct, and *thinks* that they're wrong by a LOT because this happened during a gas refill.

Upshot: this will probably never *ever* happen again because it's so unlikely (timing of the update, during the gas refill so large step, etc...) But if it does, don't worry about it: just click the red boxes to acknowledge that it happened.

HV Trip Example: 20 Oct 2014

Timeline of what happened, Oct 20 (GMT day 293)

What we did:

13:38 Error in TRD-S monitor: JINF Status Fail

13:54 next read on UHV status, HV crate off.

Also HV Status Fail in TRD-S monitor

→ Problem is clear.

14:23 HV Crate powered on again—fixed HV status, but JINF status counter has been incremented so JINF status is still “bad”.

15:37 (next equator crossing with AOS) Reload JINF config file to clear status error counters.

BETTER/EASIER SOLUTION: Skip HV power and JINF config file, simply do an HV adjustment of 0V. Should fix all problems!

13:38 JINF Error in TRD-S monitor

How To Fix, Easiest Method:
Do a HV adjustment of 0V!

***This is not what we did on Oct 20 2014,
BUT if you do an HV adjustment of 0
Volts, this should solve your problem.
If not continue with the next
procedures!***

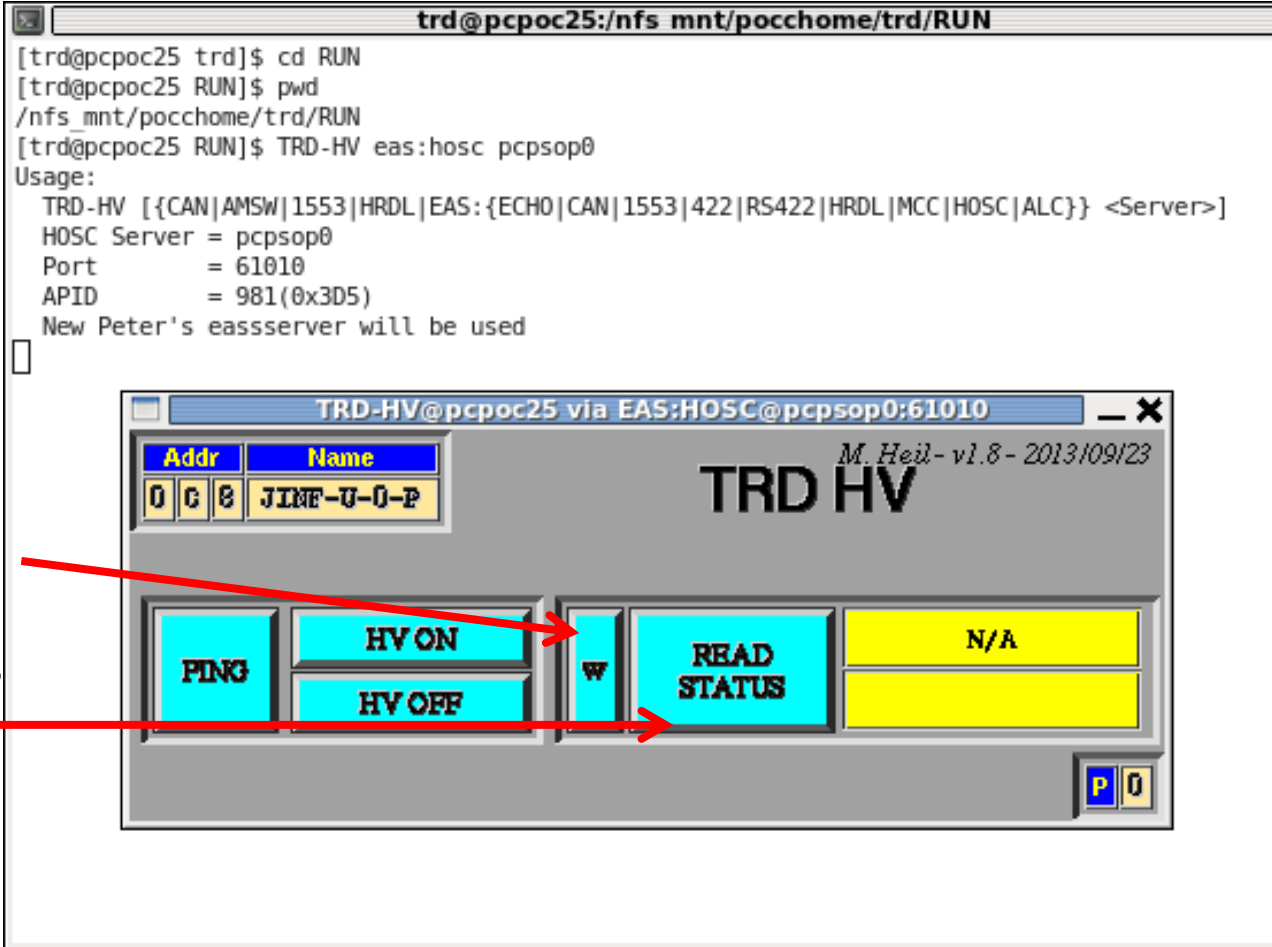

How To Fix:

1) turn on power

(a) Open the GUI (as in the terminal)

(b) Check that you're on the proper JINF (in this case U-0)

(c) Press "w" to write the status (ensures an updated status), then "Read Status" to see what it is.

```

trd@pcpoc25:/nfs_mnt/pocchome/trd/RUN
[trd@pcpoc25 trd]$ cd RUN
[trd@pcpoc25 RUN]$ pwd
/nfs_mnt/pocchome/trd/RUN
[trd@pcpoc25 RUN]$ TRD-HV eas:hosc pcpsop0
Usage:
TRD-HV [{CAN|AMSW|1553|HRDL|EAS: {ECHO|CAN|1553|422|RS422|HRDL|MCC|HOSC|ALC}} <Server>]
HOSC Server = pcpsop0
Port         = 61010
APID        = 981(0x3D5)
New Peter's eassserver will be used
  
```

TRD HV GUI window details:

Addr	Name
0 0 0	JINF-U-0-P

Buttons: PING, HV ON, HV OFF, w, READ STATUS, N/A

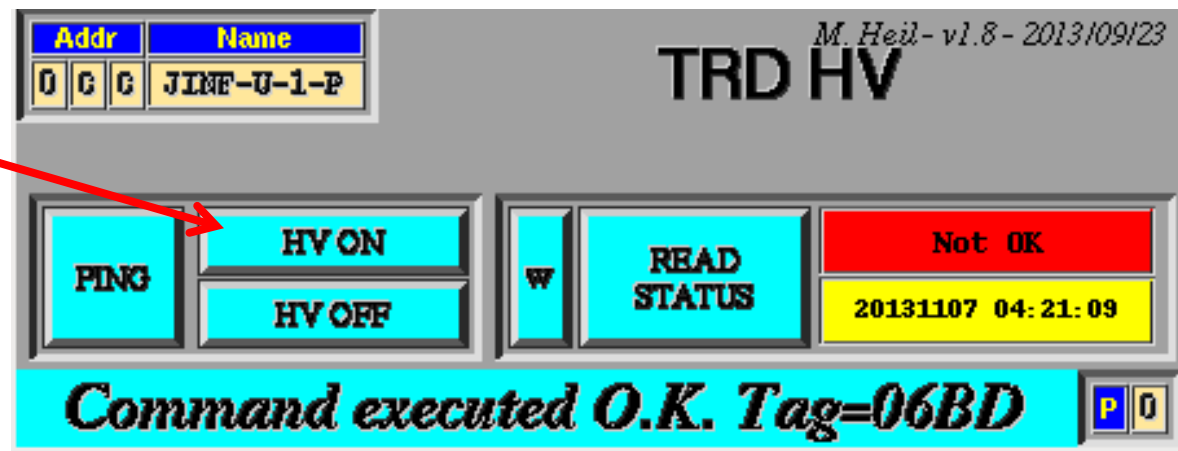

Note: Screenshots from a different day but it's the same point.

How To Fix:

1) turn on power

In this case status was bad, which we expected.

(d) Click “HV ON”

M. Heil - v1.8 - 2013/09/23

Addr	Name
0 C C	JINF-U-1-P

TRD HV

PING HV ON HV OFF w READ STATUS Not OK
20131107 04:21:09

Command executed O.K. Tag=06BD

(e) Wait a minute for it to ramp

(f) Click “w” and “Read Status” again.

Note: Screenshots from a different day but it's the same point.

How To Fix:

1) turn on power

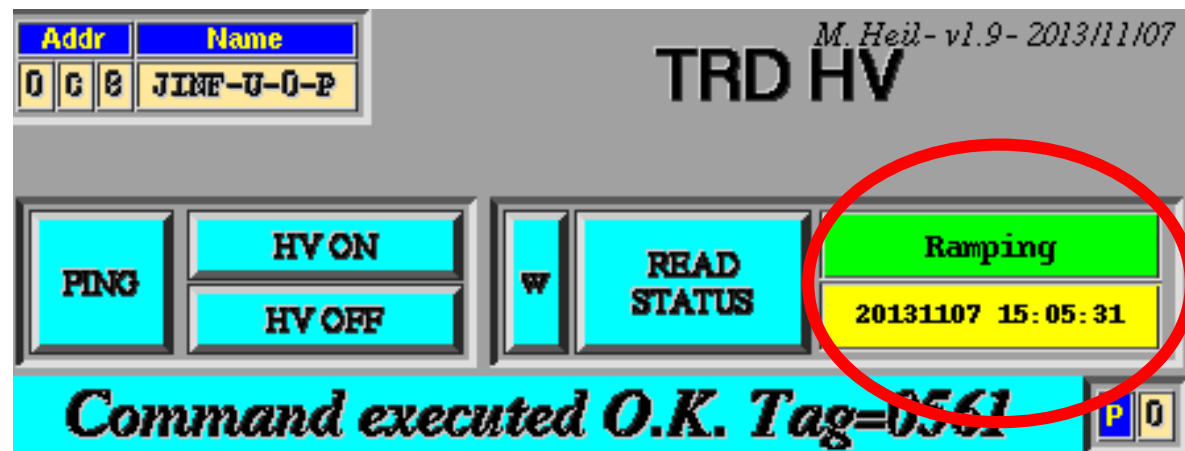

In this case status was bad, which we expected.

(d) Click “HV ON”

(e) Wait a minute for it to ramp

(f) Click “w” and “Read Status”

(g) If you do it too soon it says “ramping”. Just repeat...

Note: Screenshots from a different day but it's the same point.

How To Fix:

1) turn on power

In this case status was bad, which we expected.

(d) Click “HV ON”

(e) Wait a minute for it to ramp

(f) Click “w” and “Read Status”

(g) If you do it too soon it says “ramping”. Just repeat until it looks like this...

Note: Screenshots from a different day but it's the same point.

How To Fix:

2) reset the error counter (option 1)

In the directory `trd_acc_tas/TRD` there is a file with the commands to send:

`reset-jinfu-tripstatus.txt`

Send the commands corresponding to the proper JINF with my-t like so (for JINF-U-0):

(a) Read the status:

```
my-t R C8 14 2002
```

(b) Set the counter to 0:

```
my-t W C8 9 2001 4103 0000
```

(c) Read the status again (look for Error = 0000 at the end of the reply):

```
my-t R C8 14 2002
```

(d) Check the TRD-P-S monitor to ensure the counter has been reset (as in slides 4 and 11)

How To Fix:

2) reset the error counter (option 2)

Use the JINF controller.

It is probably safer/better if you ask LEAD to do it or to help you do it.

In case LEAD forgot: there are instructions of how to use the JINF controller in `~daq/Desktop/commander.log` under the section “DSP PROCEDURE BELOW”

LEAD does NOT need to BOOT the node, just to reload the configuration file (they should use ONLY Steps 0, 1, 5, and 6 of their procedure).

As in option 1, use the TRD-P-S monitor to ensure the counter has been reset (as in slides 4 and 11)

Initializing TRD Gas system during Power Up (UG Crate)

Powering Up UG Crate

When does this happen?

If, for example, there's a power trip on bus 3A on the ISS. This happened on 8th May 2014 at 12:21 GMT

In this case, only the TRD Gas system was powered off. The TRD itself was fine (powered on bus 4B). So this section is the complement to what we did above. (Above TRD was powered down, not TRD Gas)

With these two pieces together you can do the entire power cycle

Powering Up UG Crate

- When we saw the power trip, LEAD (K.A.) noticed a line in the chd display “ALL PUMPS OFF”, and the DAQ seemed to turn off (line DA = 0 instead of 1) without any reason.
- TRD could have noticed that the trdchd had a whole bunch of black boxes, and many of the status boxes turned red.
- The ACC scalers went crazy, and the ACC status was also bad.

See following slides for screenshots.

Powering Up UG Crate

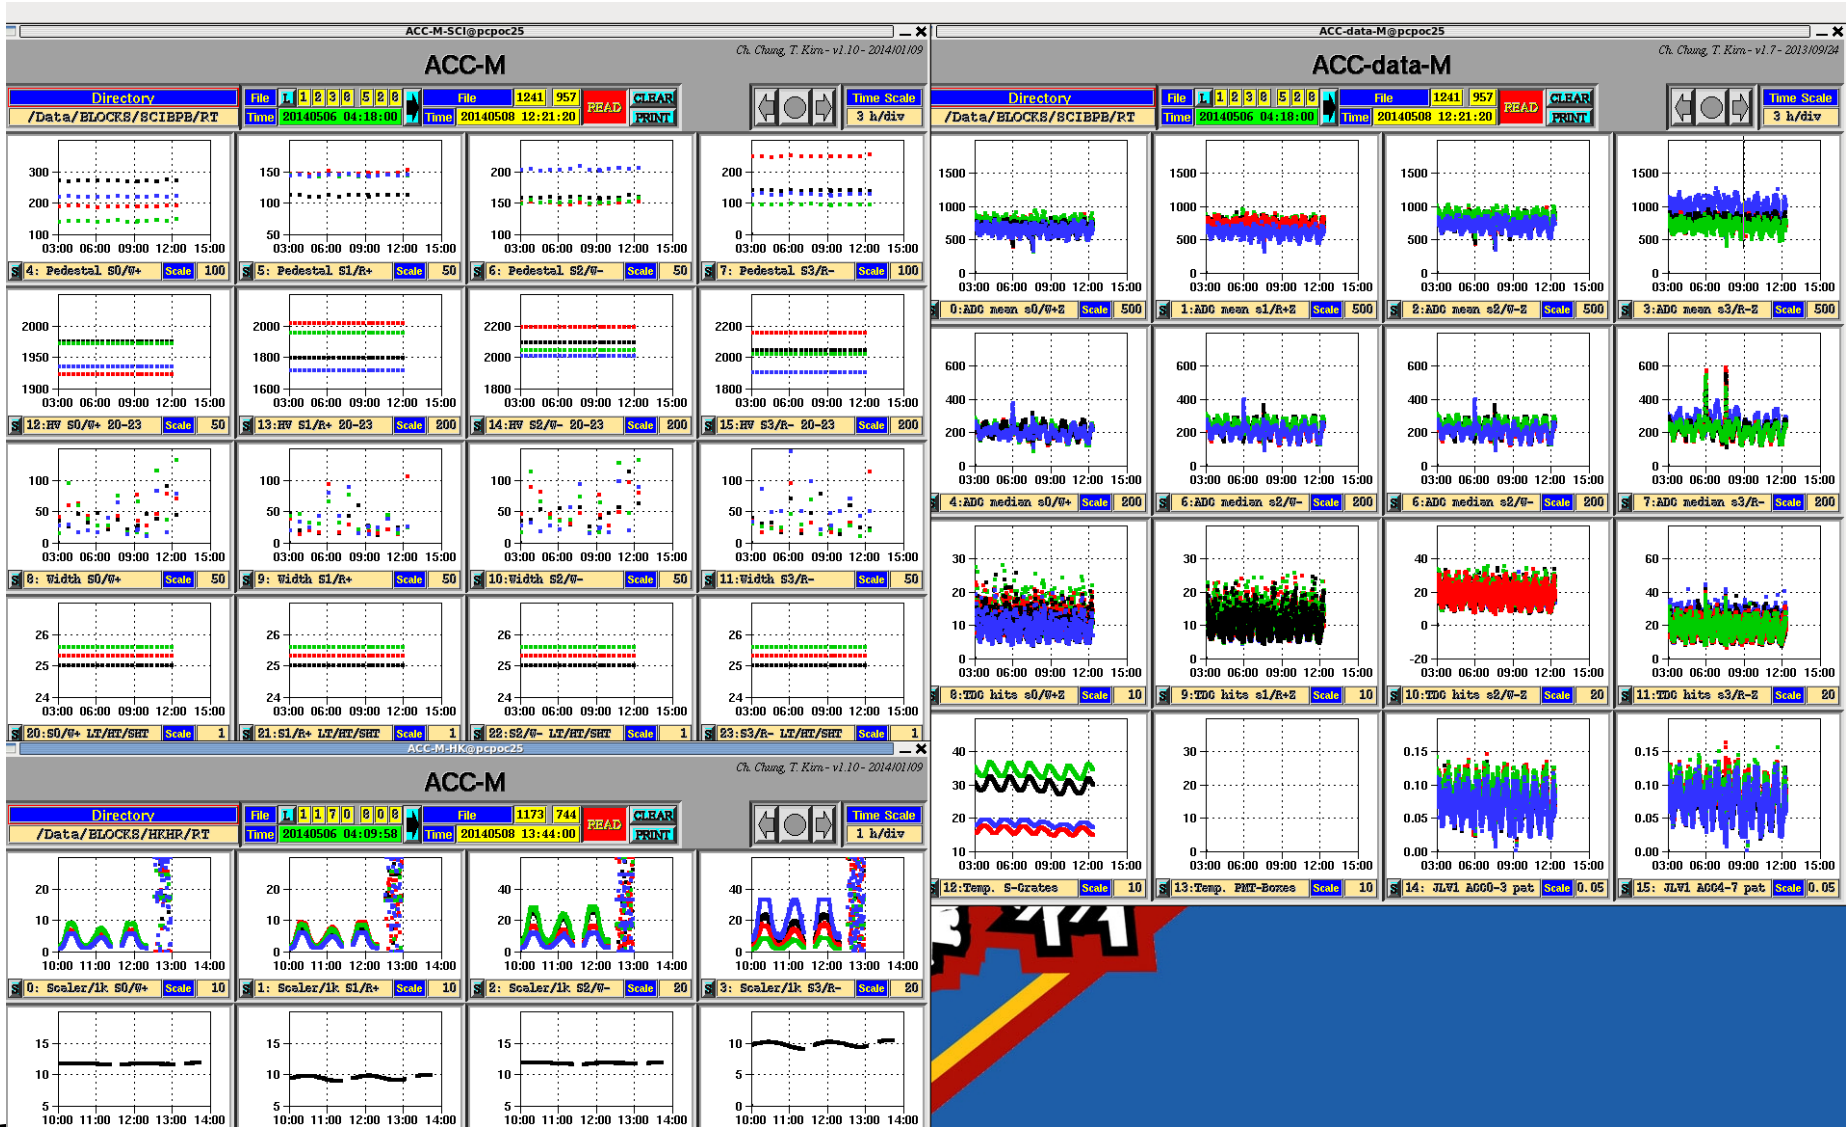

Problems in status monitors; trdchd multiple boxes not reading (black), others bad (red); DA line 0 in chd_disp

The screenshot displays a complex monitoring environment with several windows:

- TRDGas Status Monitor:** Shows directory paths, file names, and status indicators for TRD Gas Press, TRD Press, Leak, and TRD Gas Temp. It includes a log of error messages such as "RAM -2-ch3 c=41300 Scaler out of range".
- ACC Status Monitor:** Displays HV, Temperature, and Scalers status. It also shows calibration summary logs.
- TAS Status Monitor:** Shows Laser Current, Temperature, and Pulse Width status.
- TRD Status Monitor (multiple instances):** Shows JINF & Crate Power, HV (GCI-3.5-10/GC4), and UDR & DAQ status for various crates (U0, U1).
- LOOK-ATOP:** A system utility window showing running tasks and their CPU usage.
- GROUND COMMANDS:** A window showing a list of commands and their execution status for various detector components.
- CHD DISP:** A window showing a detailed log of detector status and error messages.
- Calendar:** A weekly calendar view at the bottom of the screen.

Powering Up UG Crate

No data coming for ACC: scalars (near bottom) totally bizarre.

Powering Up UG Crate

Now, what do you do about it?

- As a TRD shifter, there's nothing you can do but alert LEAD if they didn't notice.
- Wait until the power is back.
- When asked to initialize, do two things:
 - Check the TRDGasM –plots are empty?
 - Check the TRD HV (if this is the bux 3A the TRD HV should be unaffected, this is just a sanity check)
 - Initialize the UG crate.

Powering Up UG Crate

Initialize UG Crate

This is easy:

- `cd ~/RUN/COMMANDING/TRDGAS`
- `set-command-path eas:hosc pccosp0`
- `./UG_EXEC.csh A INIT`

You should get a reply with `ERR=0000` (If not, call someone immediately!)

Now, simply wait a few minutes (maybe 20) until you get new data for all systems/plots/monitors/guis and check to be sure everything is as it was before the power trip.

You may need to hit the “CLEAR” button on the Status Monitors.

Accessing the Flight Spare System

To access the flight spare system

First ask Xudong Cai to turn on the U-Crate. Then you have two command path choices. According to Bastian:

1) eas:1553 pcgsc09 (I'm using that one)

2) eas:hrdl amslaptop2 (didn't work for me last time, but it should, and commands get through faster as well)

Use these for things like:

```
set-command-path eas:1553 pcgsc09
```

and then run a command

Or as input to the controllers:

```
TRDGAS-C eas:1553 pcgsc09
```

Once you set the proper path, you can just issue the commands as normal. But be VERY VERY careful to use the proper terminal and controller, etc.

I strongly recommend doing this on an entirely separate machine so that you don't mess up on accident and send something to the space station!

What can you do with the FS system?

Generally the FS system is used to test commands that we want to send to space but aren't sure of. For example, during the UDR failure in October 2013, we tested a number of commands.

See the notes on the Oct 2014 HV trip scenario and the UDR failure in Oct 2013 which you can find on the twiki page or direct linked here:
